As a worldwide leader in offering the best SOL-C01 test torrent, we are committed to providing comprehensive service to the majority of consumers and strive for constructing an integrated service. What's more, we have achieved breakthroughs in SOL-C01 certification training application as well as interactive sharing and after-sales service. As a matter of fact, our company takes account of every client's difficulties with fitting solutions. As long as you need help, we will offer instant support to deal with any of your problems about our SOL-C01 Guide Torrent to help you pass the SOL-C01 exam.

Our desktop Snowflake Certified SnowPro Associate - Platform Certification (SOL-C01) practice exam software allows you to see your progress report at the end of each attempt. In this way, you find your mistakes and overcome them before the final take. Our desktop software is customizable so you can change the duration and Snowflake questions of SOL-C01 Practice Tests according to your learning requirements. Since this software requires installation on Windows computers, you can take the Snowflake Certified SnowPro Associate - Platform Certification (SOL-C01) practice exam offline.

## 100% Pass 2026 SOL-C01: Snowflake Certified SnowPro Associate - Platform Certification Perfect New Test Registration

Considering all customers' sincere requirements, SOL-C01 test question promise to our candidates with plenty of high-quality products, considerate after-sale services. Numerous advantages of SOL-C01 training materials are well-recognized, such as 99% pass rate in the exam, free trial before purchasing, secure privacy protection and so forth. From the customers' perspective, We treasure every customer's reliance and feedback to the optimal SOL-C01 Practice Test and be the best choice.

## Snowflake Certified SnowPro Associate - Platform Certification Sample Questions (Q213-Q218):

### NEW QUESTION # 213

What is the name for a Snowflake account holder who shares data with other Snowflake accounts?

- A. A data administrator
- **B. A data provider**
- C. A data consumer
- D. A data reader

**Answer: B**

Explanation:

In Snowflake's Secure Data Sharing model, the account sharing data is known as the data provider. Providers create shares that include selected objects (tables, views, secure views, etc.) and grant access to consumer accounts.

A data consumer receives the shared data. Data reader and data administrator are not defined terms in Snowflake's sharing architecture.

### NEW QUESTION # 214

You are developing a data pipeline in Snowflake Notebooks. One cell contains Python code that uses the Snowpark DataFrame API to perform several data transformations. After executing the cell, you observe that the execution status is 'Canceled'. What are the possible causes for this status, and how can you diagnose the issue?

- **A. The Snowflake warehouse was suspended due to inactivity, interrupting the Snowpark DataFrame operations.**
- B. An error occurred during the Snowpark DataFrame operations, triggering an automatic cancellation by the Snowflake engine.
- C. The Notebook environment encountered a memory error due to the size of the Snowpark DataFrame, leading to a cancellation.
- **D. A Snowflake administrator terminated the query associated with the Snowpark session.**
- **E. The user manually canceled the cell execution using the Notebook interface.**

**Answer: A,D,E**

Explanation:

A 'Canceled' status indicates an intentional or forced termination. Manual cancellation (A) is the most straightforward cause.

Warehouse suspension (B) will interrupt execution. A Snowflake admin can terminate queries (E). Error in Snowpark DataFrame execution (C) typically results in a failed status with an error message. Memory errors (D) could lead to a failure, but cancellation is less likely unless explicitly triggered within the code.

### NEW QUESTION # 215

Which of the following are benefits of using a multi-clustered warehouse in Snowflake? (Choose any 3 options)

- **A. Improved query performance during peak load**
- B. Reduced storage costs
- **C. Increased compute capacity**
- **D. Automatic scaling of clusters based on query demand**

**Answer: A,C,D**

Explanation:

A multi-cluster warehouse raises Snowflake's capability to handle concurrent workloads efficiently. When large numbers of users or queries hit the system, Snowflake can automatically start additional clusters (scaling out) to distribute workloads, reducing queuing and improving performance. As query demand drops, Snowflake scales in by shutting down clusters to conserve credits. This dynamic auto-scaling provides significantly increased compute capacity during peak usage periods and enhances responsiveness. Importantly, multi-cluster warehouses affect only compute, not storage, so they do not reduce storage costs.

Their primary benefits revolve around performance stability, concurrency handling, workload isolation, and compute elasticity.

### NEW QUESTION # 216

What types of privileges can be granted to a role in Snowflake?

- A. All of them
- B. MONITOR
- C. INSERT
- D. SELECT

**Answer: A**

Explanation:

Snowflake uses role-based access control (RBAC), where privileges are assigned to roles rather than individual users. All of the listed privileges (SELECT, INSERT, MONITOR) can be granted to a role.

\* SELECT allows reading data from tables, views, or materialized views.

\* INSERT allows adding new rows into a table.

\* MONITOR allows viewing query history, warehouse status, and resource usage.

In addition, roles can receive privileges such as CREATE TABLE, USAGE, MODIFY, OPERATE, OWNERSHIP, and many others. Users inherit all privileges assigned to the roles they possess, enabling scalable security design.

Thus, all listed privileges can be granted to Snowflake roles.

### NEW QUESTION # 217

You are tasked with loading data from a large number of small CSV files (each less than 10MB) stored in an S3 bucket into a single Snowflake table. You anticipate frequent additions of new CSV files to the bucket. Which of the following approaches would provide the MOST efficient and cost-effective solution for continuously loading this data into Snowflake, while minimizing operational overhead and latency? Select all that apply.

- A. Creating a Snowpipe with SQS integration and a dedicated compute warehouse only configured for the pipe.
- B. Employing a third-party ETL tool to periodically extract data from the S3 bucket, transform it, and load it into Snowflake.
- C. Using the 'COPY INTO' command with the 'VALIDATION\_MODE = RETURN\_ERRORS' parameter to load all files in the S3 bucket on a scheduled basis using a Snowflake Task.
- D. Creating a Snowpipe that uses the 'AUTO\_INGEST = TRUE' parameter and a notification integration configured to monitor the S3 bucket.
- E. Creating a Snowpipe that leverages an external function to preprocess each file before loading it into the table.

**Answer: A,D**

Explanation:

Snowpipe with 'AUTO\_INGEST = TRUE' and a notification integration (SNS/SQS) is designed for continuous loading of files from cloud storage. This is the most efficient and cost-effective solution. Batch loading with 'COPY INTO' via a Task is less responsive and incurs unnecessary costs due to scheduled execution. Third-party ETL tools add complexity and cost. While Snowpipe can use external functions, it's generally not recommended for this simple scenario and adds unnecessary overhead. For Snowpipe, a dedicated compute warehouse is an important point for a cost-effective way.
