ISTQB Certified Tester Advanced Level - Test Manager Sample Questions (Q162-Q167):

NEW QUESTION # 162

Which of the following software characteristics are possibly revealed through the application of a open source static analysis tool?
[1]

- A. Concurrency thresholds
- B. Timing dependencies

- C. Coding standard violations
- D. Memory leaks

Answer: C

Explanation:

A static analysis tool is a software tool that analyzes the source code of a program without executing it. It can detect various software characteristics, such as syntax errors, potential bugs, security vulnerabilities, code quality, and coding standard violations. Coding standard violations are deviations from the agreed or recommended rules and conventions for writing source code, such as naming, indentation, formatting, commenting, and complexity. A static analysis tool can check the source code against a predefined or customized coding standard and report any violations. Coding standard violations can affect the readability, maintainability, and portability of the code, and can also introduce defects or inconsistencies. NEW QUESTION # 163

IEEE 1028 also defines "management review" as a type of review. What is the main purpose of a management review? 1 credit

- A. Provide independent evaluation of compliance to processes, regulations, standards etc.
- B. Establish a common understanding of requirements
- C. Align technical concepts during the design phase
- D. To monitor progress, assess the status of a project, and make decisions about future actions

Answer: D

NEW QUESTION # 164

Which of the following metrics would be most beneficial to collect to determine the effectiveness of a review process? [2]

- A. The elapsed time between each module's review and its corresponding deployment into production
- B. The number of defects found in production for each module that was reviewed
- C. The business criticality of each module that was reviewed
- D. The development language used to create each module that was reviewed

Answer: B

Explanation:

The effectiveness of a review process can be measured by how well it detects and removes defects from the work products being reviewed1. One of the metrics that can indicate the defect detection capability of a review process is the number of defects found in production for each module that was reviewed2. This metric can show how many defects escaped the review process and were not detected until the software was deployed. A lower number of defects found in production means a higher review effectiveness. Therefore, option A is the correct answer. Option B is incorrect because the development language used to create each module that was reviewed is not relevant to the review process effectiveness. Option C is incorrect because the elapsed time between each module's review and its corresponding deployment into production is not a measure of defect detection or removal, but rather a measure of development speed or efficiency. Option D is incorrect because the business criticality of each module that was reviewed is not a measure of defect detection or removal, but rather a measure of risk or priority. NEW QUESTION # 165

You have been assigned to a project that has a very tight schedule. In fact, given your first analysis you do not think the planned test execution can be completed within the schedule There is no time allowed for defect fixing or for repeating tests. Regression testing has been left out of the planning entirely There is no time to develop test automation. The team has agreed that this is not the way to run a project, yet they are stuck with the current schedule Given this information what is the best way to proceed with the testing to try to meet the deadline with the best outcome1?

- A. Develop a test automation plan so that automation can be started now
- B. Continue with the current plan but highlight to the project manager that either the deadline will be missed or the testing will

not be done

- C. Conduct a quality risk analysis and prioritize the testing based on risk so the highest risk items are tested first
- D. Review the personnel plan and get more resources onto the test team

Answer: C

Explanation:

* Dealing with Tight Schedules:

* Prioritization based on quality risk ensures critical areas are tested, minimizing risks to the project.

* In tight schedules, testing everything is impractical; focus must shift to high-risk areas.

* Evaluation of Options:

* A is unlikely feasible given the tight schedule.

* B highlights the issue but does not propose a solution.

* C (developing automation) is not possible given time constraints.

* D is correct because risk-based testing ensures the best possible outcome within the constraints.

References and Syllabus Alignment:

* Risk-based testing is a core concept under "Test Process and Risk Management" in ISTQB syllabus (TM-1.3.1, TM-1.3.4).

NEW QUESTION # 166

Your application development team is performing "test-driven" development. This is a core principle of which software development model?

- A. Iterative
- B. Sequential
- C. Spiral
- D. Agile

Answer: D

Explanation:

Test-driven development (TDD) is a core principle of Agile software development. In TDD, test cases are created before the code is written, and the code is developed to pass these tests. This approach emphasizes requirements and solutions evolving through collaborative effort and is a key practice in Agile methodologies¹².

References: The Agile Alliance describes TDD as a style of programming tightly interwoven with coding, testing, and design, which is a fundamental aspect of Agile development³. Wikipedia also notes that TDD is related to the test-first programming concepts of extreme programming, an Agile methodology. This is because test-driven development (TDD) is a style of programming in which coding, testing, and design are tightly interwoven. TDD is a core principle of agile software development, which is an iterative and adaptive approach that values customer collaboration, working software, and responding to change.
