### Linux Foundation Certified GitOps Associate Sample Questions (Q52-Q57):

#### NEW QUESTION # 52

In the context of GitOps, what source of truth guides the continuous deployment process?

- A. Current State
- B. Dynamic State
- **C. Desired State**
- D. Fleeting State

**Answer: C**

Explanation:

The Desired State, stored in Git, is the ultimate source of truth in GitOps. It defines how the system should look and behave. Continuous deployment processes reconcile the actual cluster state against this Desired State.

"In GitOps, the desired state kept in Git is the single source of truth. The reconciler ensures the actual state matches the desired state, guiding the continuous deployment process." Thus, the correct answer is A.

#### NEW QUESTION # 53

In the context of GitOps, what does Desired State refer to?

- **A. The state that the system or application should be in.**
- B. The state that the system or application was in before any changes were made.
- C. The current state of the system or application.
- D. The state that the system or application will be in after all changes are made.

**Answer: A**

Explanation:

The Desired State is the declarative specification stored in Git that defines how the system should look and behave. It is the reference point against which the actual state is continuously reconciled.

"Desired state is the complete declarative specification of a system stored in Git. It defines how the system should be configured and serves as the source of truth for reconciliation." Thus, the correct answer is A.

### NEW QUESTION # 54

Which of the following statements best describes the relationship between DevOps and GitOps?

- A. DevOps and GitOps are two completely separate concepts with no relation to each other.
- B. DevOps and GitOps are interchangeable terms used to describe the same concept and principles.
- **C. GitOps is a set of principles to guide modern DevOps in practice.**
- D. DevOps and GitOps are competing methodologies, and organizations must choose one over the other.

**Answer: C**

Explanation:

GitOps is not a replacement for DevOps. Instead, it is an evolution and practical implementation of DevOps principles, using Git as the single source of truth and continuous reconciliation as the operational model.

"GitOps builds on the foundation of DevOps by providing a framework to put its principles into practice. It leverages Git and declarative reconciliation to realize DevOps goals." Thus, the best description of the relationship is B.

References: GitOps Related Practices (CNCF GitOps Working Group).

### NEW QUESTION # 55

In a GitOps-managed workflow, what is the correct way to initiate rollback?

- A. Use Helm to rollback to a previous release version.
- B. Revert to an older version and force push to the main branch.
- C. Overwrite your existing version with the code from your last working version.
- **D. Create a new version based on a former version so you always "roll forward".**

**Answer: D**

Explanation:

In GitOps, rollback is handled via version control. However, the practice is not to overwrite history but to roll forward by creating a new version that reverts to the configuration of a previous known-good commit. This maintains immutability and a complete audit trail.

"With GitOps, changes are versioned immutably. Rollbacks are performed by rolling forward to a commit that represents a previous known-good configuration, ensuring history is preserved." Thus, the correct GitOps approach is B.

### NEW QUESTION # 56

When are progressive delivery patterns useful in software development and deployment?

- A. Progressive delivery patterns are useful during initial project development instead of in subsequent phases.
- B. Progressive delivery patterns are primarily beneficial for small development teams rather than for large organizations.
- **C. Progressive delivery patterns are useful in several software development and deployment scenarios, as they offer advantages such as risk reduction, improved quality, and better user experience.**
- D. Progressive delivery patterns are only useful for one-time, single-deployment scenarios, not ongoing, continuous delivery.

**Answer: C**

Explanation:

Progressive delivery is a GitOps pattern used to release software gradually, reducing risks associated with deploying new versions. Techniques such as canary releases, feature flags, and blue-green deployments allow teams to incrementally roll out changes, validate functionality with subsets of users, and minimize potential disruptions.

"Progressive delivery builds on continuous delivery by enabling safer, incremental rollouts. This pattern reduces risk, improves reliability, enhances user experience, and allows for validation of features with a portion of users before wider release." Therefore, progressive delivery is useful in multiple scenarios (not just one-time deployments or small teams), making option C correct.
