Test AZ-800 Vce Free | Real AZ-800 Dumps Free

So many candidates have encountered difficulties in preparing to pass the AZ-800 exam. But our study materials will help candidates to pass the exam easily. Our AZ-800 guide questions can provide statistics report function to help the learners to find weak links and deal with them. The AZ-800 Test Torrent boost the function of timing and simulating the exam. They set the timer to simulate the exam and help the learners adjust the speed and keep alert.

Microsoft Administering Windows Server Hybrid Core Infrastructure Sample Questions (Q84-Q89):

NEW QUESTION # 84

Your network contains an Active Directory Domain Services (AD DS) domain. The domain contains the offices shown in the following table.

Location	Number of VPN servers	Number of remote users
Boston	2	30
Dallas	2	50
Seattle	4	

You need to deploy a Network Policy Server (NPS) named NPS1 to enforce network access policies for all remote connections. What is the minimum number of RADIUS clients that you should add to NPS1?

- A. 0
- B. 1
- C. 2
- D. 3
- E. 4

Answer: C

NEW QUESTION # 85

SIMULATION

Task 5

You need to ensure that a DHCP scope named scope1 on SRV1 can service client requests.

Answer:

Explanation:

See the solution of this Task below

Explanation:

One possible solution to ensure that a DHCP scope named scope1 on SRV1 can service client requests is to activate the scope on the DHCP server. A scope must be activated before it can assign IP addresses to DHCP clients. To activate a DHCP scope on SRV1, perform the following steps:

On SRV1, open DNS Manager from the Administrative Tools menu or by typing dnsmgmt.msc in the Run box.

In the left pane, expand your DHCP server and click on IPv4.

In the right pane, right-click on the scope that you want to activate, such as scope1, and select Activate.

Wait for the scope to be activated. You can verify the activation status by checking the icon next to the scope name. A green arrow indicates that the scope is active, while a red arrow indicates that the scope is inactive.

NEW QUESTION # 86

Task 8

You need to create an Active Directory Domain Services (AD DS) site named Site2 that is associated to an IP address range of 192.168.2.0 to 192.168.2.255.

Answer:

Explanation:

See the solution of this Task below.

Explanation:

To create an AD DS site named Site2 that is associated to an IP address range of 192.168.2.0 to 192.168.2.255, you can follow these steps:

* On a domain controller or a computer that has the Remote Server Administration Tools (RSAT) installed, open Active Directory Sites and Services from the Administrative Tools menu or by typing dssite.msc in the Run box.

* In the left pane, right-click on Sites and select New Site.

* In the New Object - Site dialog box, enter Site2 as the Name of the new site. Select a site link to associate the new site with, such as DEFAULTSITELINK, and click OK. You can also create a new site link if you want to customize the replication frequency and schedule between the sites. For more information on how to create a site link, see Create a Site Link.

* In the left pane, right-click on Subnets and select New Subnet.

* In the New Object - Subnet dialog box, enter 192.168.2.0/24 as the Prefix of the subnet. This notation represents the IP address range of 192.168.2.0 to 192.168.2.255 with a subnet mask of 255.255.255.0.

Select Site2 as the Site object to associate the subnet with, and click OK.

* Wait for the changes to replicate to other domain controllers. You can verify the site and subnet creation by checking the Sites and Subnets containers in Active Directory Sites and Services.

Now, you have created an AD DS site named Site2 that is associated to an IP address range of 192.168.2.0 to

192.168.2.255. You can add domain controllers to the new site and configure the site links and site link bridges to optimize the replication topology.

NEW QUESTION # 87

You create an Azure virtual machine named Server1 that runs Windows Server.

Server1 has the disk configuration shown in the following exhibit.

Answer:

Explanation:

Answer Area

Start Server1.

Create and attach a new data disk.

Shut down Server1.

- 1 - Start Server1.
- 2 - Create and attach a new data disk.
- 3 - Shut down Server1.

NEW QUESTION # 88

You have been tasked to decommission the member hosts from an existing server farm. As a part of the procedure, you have removed the member host from group Managed Service Account (gMSA) and now you need to remove gMSA. Which of the following cmdlet would you use in PowerShell?

- A. Remove -gMSAAccount
- **B. Uninstall-ADServiceAccount**
- C. Remove-ADServiceAccount
- D. Uninstall-gMSAAccount

Answer: B

Explanation:

The cached gMSA credentials can be removed from the member host using Uninstall- ADServiceAccount cmdlet or the NetRemoveServiceAccount API on the host system.

Syntax:

Uninstall-ADServiceAccount <ADServiceAccount>
