Juniper Security, Professional (JNCIP-SEC) Sample Questions (Q117-Q122):

NEW QUESTION # 117

Exhibit

Which two statements are correct about the output shown in the exhibit? (Choose two.)

- A. The packet is processed in the first path packet flow.

- B. The packet is processed as host inbound traffic.
- C. The packet matches the default security policy.
- D. The packet matches a configured security policy.

Answer: B,C

NEW QUESTION # 118

Exhibit:

Host A shown in the exhibit is attempting to reach the Web1 webserver, but the connection is failing. Troubleshooting reveals that when Host A attempts to resolve the domain name of the server (web.acme.com), the request is resolved to the private address of the server rather than its public IP. Which feature would you configure on the SRX Series device to solve this issue?

- A. Double NAT
- B. Persistent NAT
- C. STUN protocol
- D. DNS doctoring

Answer: D

Explanation:

DNS doctoring modifies DNS responses for hosts behind NAT devices, allowing them to receive the correct public IP address for internal resources when queried from the public network. This prevents issues where private IPs are returned and are not reachable externally. For details, visit [Juniper DNS Doctoring Documentation](#).

In this scenario, Host A is trying to resolve the domain name web.acme.com, but the DNS resolution returns the private IP address of the web server instead of its public IP. This is a common issue in networks where private addresses are used internally, but public addresses are required for external clients.

* Explanation of Answer C (DNS Doctoring):

* DNS doctoring is a feature that modifies DNS replies as they pass through the SRX device. In this case, DNS doctoring can be used to replace the private IP address returned in the DNS response with the correct public IP address for Host A. This allows external clients to reach internal resources without being aware of their private IP addresses.

Configuration Example:

```
bash
```

```
set security nat dns-doctoring from-zone untrust to-zone trust
```

Juniper Security Reference:

* DNS Doctoring Overview: DNS doctoring is used to modify DNS responses so that external clients can access internal resources using public IP addresses. Reference: [Juniper DNS Doctoring Documentation](#).

NEW QUESTION # 119

Exhibit.

Referring to the exhibit, which two statements are true? (Choose two.)

- A. External hosts cannot initiate contact.
- B. The configured solution allows IPv6 to IPv4 translation.
- C. The configured solution allows IPv4 to IPv6 translation.
- D. The IPv6 address is invalid.

Answer: B,D

NEW QUESTION # 120

You want to configure a threat prevention policy.

Which three profiles are configurable in this scenario? (Choose three.)

- A. SSL proxy profile
- B. device profile
- C. C&C profile
- D. infected host profile

- E. malware profile

Answer: C,D,E

NEW QUESTION # 121

Exhibit:

Host A shown in the exhibit is attempting to reach the Web1 webserver, but the connection is failing. Troubleshooting reveals that when Host A attempts to resolve the domain name of the server (web.acme.com), the request is resolved to the private address of the server rather than its public IP. Which feature would you configure on the SRX Series device to solve this issue?

- A. Double NAT
- B. Persistent NAT
- C. STUN protocol
- D. DNS doctoring

Answer: D

Explanation:

DNS doctoring modifies DNS responses for hosts behind NAT devices, allowing them to receive the correct public IP address for internal resources when queried from the public network. This prevents issues where private IPs are returned and are not reachable externally. For details, visit [Juniper DNS Doctoring Documentation](#).

In this scenario, Host A is trying to resolve the domain name web.acme.com, but the DNS resolution returns the private IP address of the web server instead of its public IP.
