## Latest PDII Test Fee | Test PDII Sample Online

Three formats of Salesforce PDII practice material are always getting updated according to the content of real Salesforce PDII examination. The 24/7 customer service system is always available for our customers which can solve their queries and help them if they face any issues while using the PDII Exam product. Besides regular updates, Exam-Killer also offer up to 1 year of free real Platform Developer II (PDII) exam questions updates.

Salesforce PDII Certification Exam is a rigorous test that evaluates the skills and knowledge of developers on various topics such as Apex, Visualforce, Lightning, integration, security, and data management. PDII exam consists of 60 multiple-choice questions and lasts for 120 minutes. To pass the exam, candidates must score at least 65% or higher.

Salesforce Certified Platform Developer II (PDII) is an advanced certification designed for experienced Salesforce developers who want to demonstrate their expertise in building advanced applications on the Salesforce platform. Platform Developer II certification is for individuals who have completed the Salesforce Certified Platform Developer I certification and have at least two years of experience in developing on the Salesforce platform.

## Salesforce Platform Developer II Sample Questions (Q133-Q138):

### NEW QUESTION # 133

A customer requires that when the billing address field on an Account gets updated, the address field on all its related contact records should reflect the same update.

How can this requirement be met with minimal customizations?

- A. Create a scheduled batch job that updates all contact address fields based on the related account record
- **B. Create a Lightning Process on Account to update related child Contact records**
- C. Create an After Trigger on Account to update its related contact records on update
- D. Create a Workflow Rule on Account to update related child Contact records

**Answer: B**

#### NEW QUESTION # 134

A developer creates an application event that has triggered an infinite loop. What may have caused this problem?

- A. An event is fired 'ontouched' and is unhandled.
- B. The event handler calls a trigger.
- **C. The event is fired from a custom renderer.**
- D. The event has multiple handlers registered in the project.

**Answer: C**

Explanation:

In the Aura Component Framework, an infinite loop involving an application event is frequently caused by firing the event from a custom renderer (Option B), specifically from the afterRender or rerender functions.

The framework's rendering lifecycle is sensitive. When a component's state changes, the renderer is invoked to update the DOM. If a developer places code inside a renderer that fires an application event, and that event-or a handler of that event-subsequently modifies an attribute on the same component, the component is marked as "dirty." This triggers the renderer to run again, which fires the event again, creating an infinite loop.

Option A is incorrect because multiple handlers simply result in multiple independent blocks of code executing, not a loop. Option C relates to touch events on mobile but wouldn't cause a loop unless the handler itself re-triggered the event. Option D is incorrect because triggers are server-side and do not directly re-fire client-side application events in a looping fashion. To avoid this, event firing should be restricted to controller or helper actions that are triggered by specific user interactions or discrete system states, rather than the automatic rendering cycle.

#### NEW QUESTION # 135

A developer is asked to find a way to store secret data with an ability to specify which profiles and users can access which secrets. What should be used to store this data?

- A. Custom metadata
- B. Static resources
- **C. Custom settings**
- D. system.Cookie class

**Answer: C**

Explanation:

Custom settings are a type of custom data that can be used to store secret data with an ability to specify which profiles and users can access which secrets. Custom settings can store data in a hierarchical structure, which allows the developer to set different values for different levels of access, such as organization, profile, or user. Custom settings can also be encrypted using the Protected Custom Settings feature, which prevents the data from being exposed in the user interface, the API, or Apex code. By using custom settings, the developer can store the secret data securely and control the access to the data based on the user's profile or identity. #### NEW QUESTION # 136

Refer to the test method below'

□ The test method calls a web service that updates an external system with Account information and sets the Accounts integration\_Updated\_\_c checkbox to True when it completes.

The test fails to execute and exits with an error: "Methods defined as TestMethod do not support Web service callouts."

- A. □
- B. □
- C. □
- **D. □**

**Answer: D**

Explanation:

The correct order in tests with callouts is Test.startTest(), then Test.setMock(), followed by the method invocation, and finally Test.stopTest(). This ensures the mock callout is used. References: Apex Developer Guide - Testing HTTP Callouts

### NEW QUESTION # 137

Consider the following code snippet:

As part of the deployment cycle, a developer creates the following test class:

When the test class runs, the assertion fails.

Which change should the developer implement in the Apex test method to ensure the test method executes successfully?

- A.
- B.
- C.
- D.

**Answer: C**

Explanation:

To ensure that test methods execute successfully and are able to verify the behavior of the code, it is important to set up the proper context and to make sure that the test covers the expected outcomes accurately.

\* Option B is correct because enclosing the method call within Test.startTest() and Test.stopTest() ensures that any asynchronous operations are completed before the assertions are made. This is crucial when the code being tested is expected to perform operations that may run after the initial transaction, such as future methods, queueable jobs, or batch operations.

\* Options A, C, and D are incorrect because they do not address the issue of ensuring that all operations are completed before the assertion is made. Option A incorrectly suggests modifying the test setup code, while Options C and D suggest changes that are not related to the test execution flow.
