### NEW QUESTION # 136

Business rules require a Contact to always be created when a new Account is created. What can be used when developing a custom screen to ensure an Account is not created if the creation of the Contact fails?

- A. Use a Database.Savepoint method with a try-catch block.
- B. Use the Database.Delete method if the Contact insertion fails.
- C. Use `setSavePoint()` and `rollback()` with a try-catch block.
- D. Use the Database.Insert method with `allOrNone` set to `false`.

**Answer: C**

Explanation:

This requirement calls for "Transactional Atomicity," meaning either both database operations (Account creation and Contact creation) succeed, or neither is committed to the database. In Apex, each DML statement normally acts as its own individual transaction unless managed by Savepoints.

The correct approach is to use `Database.setSavepoint()` and `Database.rollback()` within a try-catch block (Option A). The developer sets a savepoint immediately before the Account is inserted. If the Account is created successfully but the subsequent Contact insertion fails (due to a validation rule, trigger error, or system exception), the code enters the catch block. Within the catch block, the developer executes `Database.rollback(sp)`, which reverts the database to the state it was in before the Account was ever inserted.

Option B is technically similar but "A" provides the standard programmatic pattern name. Option C (`allOrNone=false`) only applies to a single list of records in one DML call and cannot link the success of an Account to a Contact. Option D (manual deletion) is an unreliable "cleanup" strategy that fails if the system crashes or if there are secondary side effects from the initial insertion. Using Savepoints ensures the platform handles the rollback safely and completely.
