Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q591-Q596):

NEW QUESTION # 591

A company runs its production workload on Amazon EC2 instances with Amazon Elastic Block Store (Amazon EBS) volumes. A solutions architect needs to analyze the current EBS volume cost and to recommend optimizations. The recommendations need to include estimated monthly saving opportunities.
Which solution will meet these requirements?

- A. Use AWS Systems Manager reporting to determine EBS volume recommendations for optimization.
- B. Use Amazon CloudWatch metrics reporting to determine EBS volume recommendations for optimization.
- C. Use AWS Compute Optimizer to generate EBS volume recommendations for optimization.
- D. Use Amazon Inspector reporting to generate EBS volume recommendations for optimization.

Answer: C

Explanation:
AWS Compute Optimizer provides detailed recommendations for optimizing Amazon EBS volumes, including insights into underutilized volumes, inefficient configurations, and potential cost savings. It analyzes usage patterns and provides recommendations based on historical data, making it the ideal tool for this use case.
* Option A (Amazon Inspector): Amazon Inspector is for security assessments, not for cost optimization.
* Option B (Systems Manager): Systems Manager does not specifically provide EBS optimization recommendations.
* Option C (CloudWatch): CloudWatch metrics help monitor usage but do not offer optimization recommendations like Compute Optimizer.

NEW QUESTION # 592

A company has Amazon EC2 instances in multiple AWS Regions. The instances all store and retrieve confidential data from the same Amazon S3 bucket. The company wants to improve the security of its current architecture.
The company wants to ensure that only the Amazon EC2 instances within its VPC can access the S3 bucket. The company must block all other access to the bucket.
Which solution will meet this requirement?

- A. Use IAM policies to restrict access to the S3 bucket.
- B. Use AWS Key Management Service (AWS KMS) with customer-managed keys to encrypt the data before sending the data to the S3 bucket.
- C. Create a VPC endpoint for Amazon S3. Configure an S3 bucket policy to allow connections only from the endpoint.
- D. Use server-side encryption (SSE) to encrypt data in the S3 bucket at rest. Store the encryption key on the EC2 instances.

Answer: C

Explanation:
Creating a VPC endpoint for S3 and configuring a bucket policy to allow access only from the endpoint ensures that only EC2 instances within the VPC can access the S3 bucket. This solution improves security by restricting access at the network level without the need for public internet access.
Option A (IAM policies): IAM policies alone cannot restrict access based on the network location.
Option B and D (Encryption): Encryption secures data at rest but does not restrict network access to the bucket.

NEW QUESTION # 593

A financial services company must retain log data for 1 year. The company stores log files in an Amazon S3 bucket and wants to prevent any user from deleting or overwriting the log files during this period. The data must remain available for read-only requests.

- A. Enable S3 Versioning on the bucket. Create an S3 Lifecycle Configuration rule to move objects to Amazon S3 Glacier Flexible Retrieval after 1 year.
- B. Create an AWS Lambda function to programmatically check the timestamp of S3 data and to move the data to Amazon S3 Glacier Deep Archive if the data is older than 1 year.
- C. Enable S3 Versioning on the bucket. Use Object Lock in compliance mode with a 1-year retention period.
- D. Enable S3 Transfer Acceleration on the bucket. Create an S3 Lifecycle Configuration rule to move objects to Amazon S3 Glacier Flexible Retrieval after 1 year.

Answer: C

Explanation:
Comprehensive and Detailed Explanation:
To ensure that log files are immutable and cannot be deleted or overwritten for a specified retention period, Amazon S3 offers Object Lock in Compliance Mode. When enabled:
* Compliance Mode: Ensures that a protected object version can't be overwritten or deleted by any user, including the root user in your AWS account, for the duration of the retention period. AWS Documentation
* S3 Versioning: Must be enabled on the bucket to use Object Lock. This allows multiple versions of an object to be stored, ensuring that previous versions are preserved and protected. Amazon Web Services, Inc.
By enabling S3 Versioning and applying Object Lock in Compliance Mode with a 1-year retention period, the company can meet regulatory requirements to retain log data securely and prevent any modifications or deletions during that time.

NEW QUESTION # 594

A company is running an SMB file server in its data center. The file server stores large files that are accessed frequently for the first few days after the files are created. After 7 days the files are rarely accessed.
The total data size is increasing and is close to the company's total storage capacity. A solutions architect must increase the company's available storage space without losing low-latency access to the most recently accessed files. The solutions architect must also provide file lifecycle management to avoid future storage issues.
Which solution will meet these requirements?

- A. Create an Amazon S3 File Gateway to extend the company's storage space. Create an S3 Lifecycle policy to transition the data to S3 Glacier Deep Archive after 7 days.
- B. Install a utility on each user's computer to access Amazon S3. Create an S3 Lifecycle policy to transition the data to S3 Glacier Flexible Retrieval after 7 days.
- C. Create an Amazon FSx for Windows File Server file system to extend the company's storage space.
- D. Use AWS DataSync to copy data that is older than 7 days from the SMB file server to AWS.

Answer: A

Explanation:
Explanation
Amazon S3 File Gateway is a hybrid cloud storage service that enables on-premises applications to seamlessly use Amazon S3 cloud storage. It provides a file interface to Amazon S3 and supports SMB and NFS protocols.
It also supports S3 Lifecycle policies that can automatically transition data from S3 Standard to S3 Glacier Deep Archive after a specified period of time. This solution will meet the requirements of increasing the company's available storage space without losing low-latency access to the most recently accessed files and providing file lifecycle management to avoid future storage issues.

NEW QUESTION # 595

An ecommerce company runs applications in AWS accounts that are part of an organization in AWS Organizations. The applications run on Amazon Aurora PostgreSQL databases across all the accounts. The company needs to prevent malicious activity and must identify abnormal failed and incomplete login attempts to the databases. Which solution will meet this requirement?

- A. Enable the Amazon RDS Protection feature in Amazon GuardDuty for the member accounts of the organization.

- B. Publish the Aurora general logs to a log group in Amazon CloudWatch Logs. Export the log data to a central Amazon S3 bucket.
- C. Publish all the Aurora PostgreSQL database events in AWS CloudTrail to a central Amazon S3 bucket.
- D. Attach service control policies (SCPs) to the root of the organization to identify the failed login attempts.

Answer: A

Explanation:
Amazon GuardDuty includes RDS Protection that "monitors and profiles access to your Amazon Aurora and Amazon RDS databases" to detect threats such as suspicious login attempts, brute- force activity, and anomalous authentication patterns. GuardDuty can be enabled organization- wide in AWS Organizations with a delegated administrator to centralize findings for all member accounts, minimizing operational overhead. Findings include context like source IP, user, and DB instance, and integrate with Amazon EventBridge for alerting and automated response. SCPs (A) enforce or deny API permissions but do not provide detection/analytics. Exporting general logs (C) requires building and maintaining custom parsing/analytics pipelines. CloudTrail (D) records AWS control-plane API calls and does not log database-level login attempts. Therefore, enabling GuardDuty RDS Protection across the org provides the most operationally efficient, managed detection of abnormal failed and incomplete login attempts.
