Our company has taken a lot of measures to ensure the quality of our SOL-C01 preparation materials. It is really difficult for us to hire a professional team, regularly investigate market conditions, and constantly update our SOL-C01 exam questions. But we persisted for so many years. And our quality of our SOL-C01 study braindumps are praised by all of our worthy customers. And you can always get the most updated and latest SOL-C01 training guide if you buy them.

The page of our SOL-C01 simulating materials provides demo which are sample questions. The purpose of providing demo is to let customers understand our part of the topic and what is the form of our SOL-C01 study materials when it is opened? In our minds, these two things are that customers who care about the SOL-C01 Exam may be concerned about most. We will give you our software which is a clickable website that you can visit the product page.

Snowflake Certified SnowPro Associate - Platform Certification Sample Questions (Q37-Q42):

NEW QUESTION # 37

A data engineering team uses Snowflake to load and transform large datasets. They have observed that a specific transformation job consistently takes an unacceptably long time to complete, even though the warehouse is sized at X-LARGE. Which of the following actions, individually or in combination, would be MOST effective in reducing the job's execution time?

- A. Upgrade the warehouse to a 2X-LARGE size. This ensures more compute resources are available.
- B. Review the query execution plan to identify performance bottlenecks such as full table scans or inefficient joins, and optimize the SQL code accordingly. This is often more effective than simply increasing warehouse size.
- C. Change the warehouse from 'Auto-Suspend' to 'Never-suspend' to keep the warehouse active even when idle.
- D. Enable Multi-cluster warehouse and set the minimum and maximum clusters to 1 and 1 respectively. This will allow for automatic scaling.
- E. Partition the source data into smaller files. Smaller files are always loaded faster.

Answer: B

Explanation:

While increasing warehouse size (A) might help, it's a brute-force approach. Multi-cluster with min/max set to 1 (B) is essentially a single warehouse. 'Never-suspend' (D) only keeps the warehouse running, not faster. Smaller files (E) is relevant during data loading but the question focuses on transformation. The most effective action is always optimizing the SQL query itself (C). This addresses the root cause of the performance issue, which is likely inefficient query processing, rather than simply throwing more hardware at the problem. Analyzing the query plan will reveal bottlenecks that can be addressed with indexing, query rewriting, or data clustering.

NEW QUESTION # 38

Which of the following statements are TRUE regarding Snowflake's data sharing capabilities and its impact on storage costs and data governance? (Select TWO)

- A. Data sharing in Snowflake involves physically copying the data to the consumer's account, resulting in increased storage costs for both the provider and the consumer.
- B. Data providers can revoke access to shared data at any time, ensuring data governance and security.
- C. Consumers can modify the shared data within their Snowflake account without affecting the original data in the provider's account.
- D. Data sharing in Snowflake allows providers to share live, up-to-date data without physically copying it, resulting in zero storage costs for consumers.
- E. Data sharing is only possible between Snowflake accounts within the same cloud region.

Answer: B,D

Explanation:

Snowflake's data sharing architecture allows sharing data without copying, resulting in zero storage costs for consumers. Providers retain control over their data and can revoke access.

Option A is incorrect as data is not copied. Option D is incorrect because shared data is read-only for consumers. Option E is incorrect as cross-region sharing is possible with replication.

NEW QUESTION # 39

Which of the following are valid Snowflake Virtual Warehouse sizes? (Choose any 3 options)

- A. Tiny
- B. Small
- C. Medium
- D. Xsmall

Answer: B,C,D

Explanation:

Snowflake warehouse sizes follow T-shirt sizing, each representing a doubling of compute resources relative to the previous size. Valid Snowflake warehouse sizes include X-Small, Small, Medium, Large, and up to 6X-Large.

X-Small is the smallest supported warehouse size and is commonly used for light data processing, development tasks, and low-volume operations.

Small doubles the compute capacity of X-Small, providing better performance for moderate workloads.

Medium continues scaling upward, offering increased CPU, memory, and parallelism for heavier analytics or transformation workloads.

Tiny is not a Snowflake warehouse size. Snowflake never exposes a warehouse smaller than X-Small, ensuring consistent minimum compute capabilities.

These standardized size tiers allow predictable resource scaling and cost forecasting.

NEW QUESTION # 40

A data engineer is tasked with creating a Python script to load data from a local CSV file into a Snowflake table named 'SALES DATA'. The CSV file contains columns 'product id', 'sale date', and 'sale amount'. The engineer wants to use Snowpark to efficiently achieve this. Which of the following code snippets demonstrates the most optimized approach using Snowpark's 'copy_into table' method, assuming the Snowpark session 'session' is already established, the file format object 'my_csv_format' is defined correctly for CSV parsing, and the stage is configured for file access?

- A.

- B.
- C.
- D.
- E.

Answer: C

Explanation:

The `copy_into` method available on Snowpark DataFrame/Table objects allows you to leverage Snowflake's native COPY command for efficient data loading. Option C correctly uses

``session.table("SALES_DATA").copy_into("@my_stage/sales_data.csv",` to perform the copy operation. Options A and D do not utilize the COPY command directly and might not be as optimized. Option B uses `session.sql` which doesn't leverage Snowpark's DataFrame API. Option E incorrectly defines the `file_format` as a dictionary. The 'file_format' parameter expects only the name of existing File Format Object.

NEW QUESTION # 41

You need to configure Snowflake to automatically suspend a virtual warehouse named

``ANALYTICS` after 10 minutes of inactivity and resume it when a query is submitted. Which of the following SQL commands achieve this?

- A. `ALTER WAREHOUSE ANALYTICS_WH SET AUTO SUSPEND = 600; ALTER WAREHOUSE ANALYTICS_WH SET AUTO RESUME = TRUE; ALTER WAREHOUSE ANALYTICS_WH SET AUTO RESUME INITIAL SIZE = 'MEDIUM';`
- B. ``sql ALTER WAREHOUSE ANALYTICS_WH SET AUTO SUSPEND = 10; ALTER WAREHOUSE ANALYTICS_WH SET AUTO RESUME = TRUE;`
- C. `ALTER WAREHOUSE ANALYTICS_WH SET AUTO SUSPEND = 600; ALTER WAREHOUSE ANALYTICS_WH SET AUTO RESUME = TRUE;`
- D. ``sql ALTER WAREHOUSE ANALYTICS_WH SET AUTO SUSPEND = TRUE; ALTER WAREHOUSE ANALYTICS_WH SET INACTIVITY_TIMEOUT = 600`
- E. `ALTER WAREHOUSE ANALYTICS_WH SET AUTO SUSPEND = 600; ALTER WAREHOUSE ANALYTICS_WH SET AUTO RESUME = 'ON`

Answer: C

Explanation:

The 'AUTO_SUSPEND' parameter controls the number of seconds of inactivity before a warehouse is automatically suspended. 10 minutes is equal to 600 seconds. 'AUTO RESUME' set to 'TRUE' enables the warehouse to automatically resume when a query is submitted. Option B is incorrect because 'INACTIVITY_TIMEOUT' does not exist. Option C is incorrect as 'AUTO_RESUME' only accepts boolean values. Option D is incorrect as auto suspend is configured for only 10 seconds. Option E is unnecessarily complicated, the core functionality is achieved by the two commands in option A. Setting initial warehouse size is an optimization, not essential for auto resume to function.
