- B. Extract is typically used to produce local trail files over a TCP/IP connection.
- C. RMTTRAIL is for remote trails and EXTTRAIL is for local trails.
- D. Trail files are used to show how many records your Distribution Path is trailing behind the Extract.

Wait until the data pump/Replicat are finished processing the data in their respective trails. Stop the data pump/Replicat. Apply the patch on the target. If the patches changed table defs, run DEFGEN for the source tables to generate updated source defs, and then replace the old defs with the new ones in the existing source defs file on the target. Start GG processes when ready to begin capturing activity again.**
