Salesforce Certified Identity and Access Management Architect Sample Questions (Q230-Q235):

NEW QUESTION # 230

What information does the 'Relaystate' parameter contain in sp-Initiated Single Sign-on?

- **A. Reference to a URL redirect parameter at the service provider.**
- B. Reference to the login address URL of the identity Provider.
- C. Reference to the login address URL of the service provider.
- D. Reference to a URL redirect parameter at the identity provider.

Answer: A

NEW QUESTION # 231

Northern Trail Outfitters (NTO) uses Salesforce Experience Cloud sites (previously known as Customer Community) to provide a digital portal where customers can login using their Google account.

NTO would like to automatically create a case record for first time users logging into Salesforce Experience Cloud.

What should an Identity architect do to fulfill the requirement?

- A. Implement a Just-in-Time handler class that has logic to create cases upon first login.
- B. Configure an authentication provider for Social Login using Google and a custom registration handler.
- **C. Implement a login flow with a record create component for Case.**
- D. Create an authentication provider for Social Login using Google and leverage standard registration handler.

Answer: C

Explanation:

Explanation

To automatically create a case record for first time users logging into Salesforce Experience Cloud using their Google account, the identity architect should implement a login flow with a record create component for Case.

A login flow is a custom post-authentication process that can be used to add additional screens or logic after a user logs in to Salesforce. A record create component is a type of flow element that can be used to create a new record in Salesforce. By implementing a login flow with a record create component for Case, the identity architect can check if the user is logging in for the first time using their Google account and create a case record accordingly. References: Login Flows, Record Create Element

NEW QUESTION # 232

Universal Containers wants to allow its customers to log in to its Experience Cloud via a third-party authentication provider that supports only the OAuth protocol.

What should an identity architect do to fulfill this requirement?

- A. Use certificate-based authentication.
- B. Configure OpenID Connect authentication provider.
- C. Contact Salesforce Support and enable delegate single sign-on.
- **D. Create a custom external authentication provider.**

Answer: D

Explanation:

If the third-party authentication provider supports only the OAuth protocol and not OpenID Connect, then an identity architect needs to create a custom external authentication provider for it. A custom external authentication provider is a configuration that allows users to log in to Salesforce using an external identity provider that is not predefined by Salesforce. It requires implementing the Auth.AuthProviderPlugin interface and defining the OAuth endpoints and parameters.

NEW QUESTION # 233

Universal Containers (UC) employees have Salesforce access from restricted IP ranges only, to protect against unauthorized access. UC wants to rollout the Salesforce1 mobile app and make it accessible from any location.

Which two options should an architect recommend? Choose 2 answers

- A. Use login flow to bypass IP range restriction for the mobile app.
- B. Remove existing restrictions on IP ranges for all types of user access.
- **C. Relax the IP restriction with a second factor in the connect app settings for Salesforce1 mobile app**
- **D. Relax the IP restriction in the connect app settings for the Salesforce1 mobile app**

Answer: C,D

Explanation:

Explanation

Relaxing the IP restriction in the connected app settings for the Salesforce1 mobile app and relaxing the IP restriction with a second factor in the connected app settings for Salesforce1 mobile app are two options that an architect should recommend. These options allow UC employees to access the Salesforce1 mobile app from any location, while still maintaining some level of security. Relaxing the IP restriction means that users can log in to the connected app from outside the trusted IP ranges defined in their profiles¹.

Adding a second factor means that users need to provide an additional verification method, such as a verification code or a security key, to access the app². Using a login flow to bypass IP range restriction for the mobile app is not a recommended option because it can create a complex and inconsistent user experience³. Removing existing restrictions on IP ranges for all types of user access is not a recommended option because it can expose UC's data and applications to unauthorized access⁴. References: 1: Restrict Access to Trusted IP Ranges for a Connected App 2: Require Multi-Factor Authentication for Connected Apps 3: [Custom Login Flows] 4:

[Restrict Login Access by IP Address]

NEW QUESTION # 234

Universal Containers (UC) uses Active Directory (AD) as their identity store for employees and must continue to do so for network access. UC is undergoing a major transformation program and moving all of their enterprise applications to cloud platforms including Salesforce, Workday, and SAP HANA. UC needs to implement an SSO solution for accessing all of the third-party cloud applications and the CIO is inclined to use Salesforce for all of their identity and access management needs.

Which two Salesforce license types does UC need for its employees'

Choose 2 answers

- A. Chatter Only and Identity licenses
- B. Company Community and Identity licenses
- **C. Salesforce and Identity Connect licenses**
- **D. Identity and Identity Connect licenses**

Answer: C,D

Explanation:

Explanation

The two Salesforce license types that UC needs for its employees are Identity and Identity Connect licenses.

According to the Salesforce documentation, "Identity licenses let your employees access any app that supports standards-based
