

Top New CCDAK Test Guide Pass Certify | High Pass-Rate CCDAK Valid Exam Bootcamp: Confluent Certified Developer for Apache Kafka Certification Examination

BONUS!!! Download part of NewPassLeader CCDAK dumps for free: <https://drive.google.com/open?id=14tbnA3BdjEwre0XwnlR5rjeGJoe5oD4>

Whether you are at home or out of home, you can study our CCDAK test torrent. You don't have to worry about time since you have other things to do, because under the guidance of our CCDAK study tool, you only need about 20 to 30 hours to prepare for the exam. You can use our CCDAK exam materials to study independently. Then our system will give you an assessment based on your actions. You can understand your weaknesses and exercise key contents. You don't need to spend much time on it every day and will pass the exam and eventually get your certificate. CCDAK Certification can be an important tag for your job interview and you will have more competitiveness advantages than others.

Confluent CCDAK Exam Overview:

Certification Vendor:	Confluent
Exam Name:	Confluent Certified Developer for Apache Kafka Certification Examination
Exam Number:	CCDAK
Certificate Validity Period:	2 years
Related Certifications:	Confluent Certified Administrator for Apache Kafka (CCAAK) Confluent Cloud Certified Operator (CCAC)
Exam Price:	\$150 USD
Available Languages:	English
Exam Format:	Matching, Multiple-choice, List order

Exam Duration:	90 minutes
Real Exam Qty:	60
Passing Score:	Pass / Fail
Recommended Training:	Confluent Documentation Confluent Developer Training for Apache Kafka
Exam Registration:	Confluent Certification Portal
Sample Questions:	Confluent CCDAK Sample Questions
Exam Way:	Remote proctored online exam, requires webcam, microphone, Google Chrome browser
Pre Condition:	No mandatory prerequisites; recommended experience: 6+ months developing applications with Apache Kafka
Official Syllabus URL:	https://www.confluent.io/certification/

>> New CCDAK Test Guide <<

100% Pass Quiz Perfect CCDAK - New Confluent Certified Developer for Apache Kafka Certification Examination Test Guide

With CCDAK study materials, you will have more flexible learning time. With CCDAK study materials, you can flexibly arrange your study time according to your own life. You don't need to be in a hurry to go to classes after work as the students who take part in a face-to-face class, and you also never have to disrupt your schedule for learning. CCDAK Study Materials help you not only to avoid all the troubles of learning but also to provide you with higher learning quality than other students'.

The CCDAK certification exam is offered by Confluent, the company that created Apache Kafka. CCDAK exam is designed to be rigorous and challenging, and passing it requires a deep understanding of Kafka-based solutions and their application to real-world use cases. The CCDAK Certification is a valuable credential for developers who work with Kafka and want to demonstrate their expertise to potential employers or clients.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q88-Q93):

NEW QUESTION # 88

Producing with a key allows to...

- **A. Influence partitioning of the producer messages**
- B. Ensure per-record level security
- C. Allow a Kafka Consumer to subscribe to a (topic,key) pair and only receive that data
- D. Add more information to my message

Answer: A

Explanation:

Keys are necessary if you require strong ordering or grouping for messages that share the same key. If you require that messages with the same key are always seen in the correct order, attaching a key to messages will ensure messages with the same key always go to the same partition in a topic. Kafka guarantees order within a partition, but not across partitions in a topic, so alternatively not providing a key - which will result in round-robin distribution across partitions - will not maintain such order.

NEW QUESTION # 89

(You create a topic with five partitions.

What can you assume about messages read from that topic by a single consumer group?)

- A. All messages will be read from exactly one broker by the consumer group.
- B. The consumer group can only read the same number of messages from all the partitions.
- **C. Messages can be consumed by a maximum of five consumers in the same consumer group.**
- D. Messages from one partition can be consumed by any of the consumers in a group for faster processing.

Answer: C

Explanation:

The Apache Kafka documentation explains that Kafka's parallelism model is based on topic partitions and consumer groups. Within a single consumer group, each partition can be assigned to at most one consumer at a time. As a result, the maximum level of parallelism for a consumer group is equal to the number of partitions in the topic.

In this scenario, the topic has five partitions, which means that up to five consumers in the same consumer group can actively consume data in parallel. If more than five consumers are added, the extra consumers will remain idle because there are no additional partitions to assign.

Option B is incorrect because Kafka does not enforce equal message consumption across partitions; message distribution depends on producers and partitioning strategy. Option C is false because partitions may be hosted on different brokers, and consumers fetch data from multiple brokers. Option D is incorrect because a single partition cannot be consumed by multiple consumers within the same group simultaneously.

Therefore, the only valid assumption is that a maximum of five consumers can actively consume messages in the same consumer group.

NEW QUESTION # 90

(You are developing a Kafka Streams application with a complex topology that has multiple sources, processors, sinks, and sub-topologies.

You are working in a development environment and do not have access to a real Kafka cluster or topics.

You need to perform unit testing on your Kafka Streams application.

Which should you use?)

- **A. TopologyTestDriver**
- B. TestProducer, TestConsumer
- C. MockProducer, MockConsumer
- D. KafkaUnitTestDriver

Answer: A

Explanation:

The official Apache Kafka Streams developer documentation clearly states that TopologyTestDriver is the recommended and supported tool for unit testing Kafka Streams applications without requiring a running Kafka cluster. It is specifically designed to test complex topologies consisting of multiple sources, processors, state stores, sinks, and even sub-topologies.

TopologyTestDriver allows developers to instantiate the Kafka Streams topology directly in memory and feed test records into input topics while reading results from output topics. This makes it ideal for fast, deterministic, and isolated unit tests. As documented, it supports testing stateful and stateless operations, windowed aggregations, joins, and exactly-once behavior at the topology level.

Option A is incorrect because TestProducer and TestConsumer are not official Kafka Streams testing utilities.

Option B is invalid because KafkaUnitTestDriver does not exist in Apache Kafka. Option D (MockProducer and MockConsumer) belongs to the Kafka Clients API and is suitable for producer/consumer testing, but it does not support Kafka Streams topologies or state stores.

Therefore, TopologyTestDriver is the only fully supported and officially documented solution for unit testing Kafka Streams applications without a real Kafka cluster.

NEW QUESTION # 91

What happens when broker.rack configuration is provided in broker configuration in Kafka cluster?

- A. Replicas for a partition are placed in the same rack
- B. You can use the same broker.id as long as they have different broker.rack configuration
- C. Each rack contains all the topics and partitions, effectively making Kafka highly available
- **D. Replicas for a partition are spread across different racks**

Answer: D

Explanation:

Partitions for newly created topics are assigned in a rack alternating manner, this is the only change broker.rack does

NEW QUESTION # 92

You have a Kafka client application that has real-time processing requirements.

Which Kafka metric should you monitor?

- A. Total time to serve requests to replica followers
- B. Aggregate incoming byte rate
- C. Consumer lag between brokers and consumers
- D. Consumer heartbeat rate to group coordinator

Answer: C

Explanation:

For real-time applications, the key metric to monitor is consumer lag- the difference between the latest offset on the broker and the last committed offset by the consumer.

FromKafka Monitoring Guide:

"Consumer lag is the most important metric for real-time applications. It tells you how far behind the consumer is from the latest data in Kafka."

* B relates to replication, not client responsiveness.

* C tracks group membership stability, not data delay.

* D tracks input throughput, not processing latency.

Reference:Kafka Operations > Monitoring> Consumer Lag
