Fortinet FCP - Google Cloud Security 7.6 Administrator Sample Questions (Q16-Q21):

NEW QUESTION # 16

Your organization is running an application in their shared services virtual public cloud (VPC) and must control network access natively in the cloud.

How can your organization meet this requirement?

- A. Create another VPC in front of the shared services VPC and deploy FortiGate.
- B. Create a firewall policy for the entire VPC that allows access from all networks.
- C. Create a firewall rule that allows access to the application instance only.
- D. Create IAM access to allow access from specified resources only.

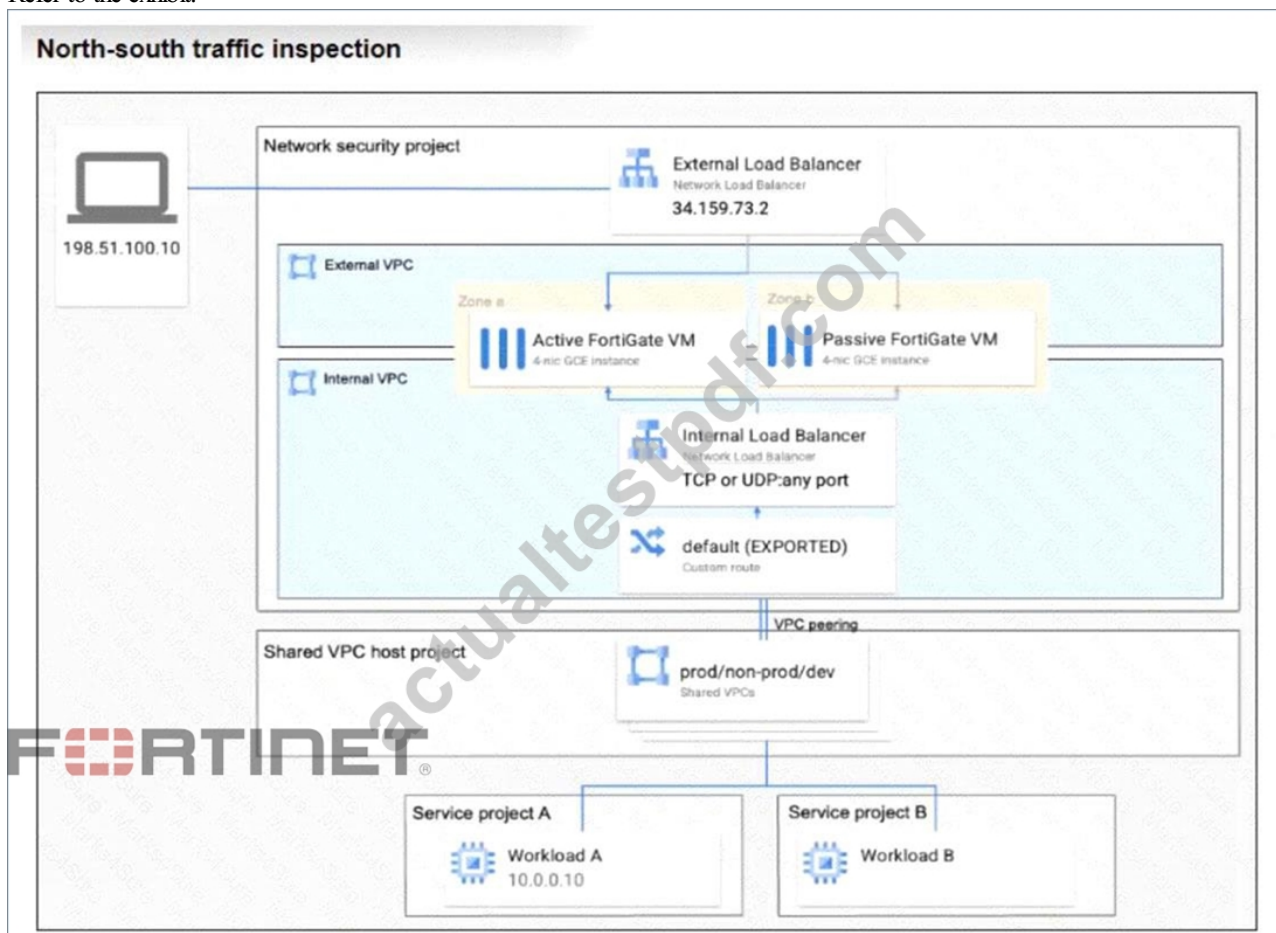

Answer: C

Explanation:

Creating specific firewall rules that restrict access directly to the application instance allows precise native network access control within the shared services VPC.

NEW QUESTION # 17

Refer to the exhibit.

Which two types of traffic flow must the FortiGate cluster inspect, if the client at 198.51.100.10 sends traffic to the Workload A instance? (Choose two.)

- A. West-bound
- B. North-bound
- C. East-bound

- D. South-bound

Answer: C,D

Explanation:

South-bound traffic refers to traffic coming from outside the network (the client 198.51.100.10) into the internal environment. East-bound traffic refers to traffic moving laterally within the internal network, such as between VPCs or workloads, which the FortiGate cluster can inspect for internal threats.

NEW QUESTION # 18

Your organization has decided to deploy a high-availability (HA) cluster. One key requirement of the deployment is to support configuration synchronization.

Which three deployment types should be considered? (Choose three.)

- A. Active-passive HA using software-defined networking (SDN)
- B. Active-active HA using auto scaling
- C. Active-passive HA using passthrough load balancers
- D. Active-passive HA using FGSP

Answer: A,C,D

Explanation:

These three deployment types support configuration synchronization between HA cluster members, which is critical for maintaining consistent state and seamless failover.

NEW QUESTION # 19

An organization has decided to deploy an active-active high-availability cluster in Google Cloud.

Which three load balancing features are critical to the successful deployment of the cluster? (Choose three.)

- A. The symmetric hashing of the internal passthrough network load balancer
- B. The forwarding rule for the internal passthrough network load balancer as the next hop for custom routes
- C. The session termination of the external passthrough network load balancer
- D. The L3_DEFAULT protocol in the forwarding rule of the internal passthrough network load balancer
- E. The health check used by the internal and the external passthrough network load balancer

Answer: A,B,E

Explanation:

Health checks ensure load balancers route traffic only to healthy cluster members.

Forwarding rules act as next hops in routing, directing traffic appropriately within the HA cluster.

Symmetric hashing ensures consistent and balanced traffic distribution across cluster members, critical for active-active deployments.

NEW QUESTION # 20

An organization decided to decommission a deployed FortiWeb instance on Google Cloud.

What is the most efficient way to delete the FortiWeb instance and all of its dependent resources?

- A. Use Google Cloud Deployment Manager to delete the FortiWeb deployment.
- B. Delete the FortiWeb instance manually in the Compute Engine portal.
- C. Use Google Cloud Solutions to delete the FortiWeb deployment.
- D. Visit Google Cloud Marketplace and unsubscribe from FortiWeb pay-as-you-go.

Answer: A

Explanation:

Google Cloud Deployment Manager manages the lifecycle of deployments and their dependent resources, enabling efficient and clean deletion of FortiWeb instances and all associated resources in one operation.

NEW QUESTION # 21
