問題 #48

A cloud engineer wants to deploy a new application to the cloud and is writing the following script:

```

terraform {
  required_providers {
    cloud_provider1 = {
      source = "hashicorp/cloud_provider1"
      version = "~> 4.16"
    }
  }
  required_version = ">= 1.2.0"
}
provider "cloud_provider1" {
  region = "us-west-2"
}
resource "server_instance" "app_server" {
  ami = "ami-830c94e3"
  instance_type = "t2.micro"
  tags = {
    Name = "AppServerInstance"
  }
}

```

Which of the following actions will this script perform?

- A. Upload a new VM image.
- B. Import a cloud module.
- C. Build a local server.
- D. Create a new cloud resource.

答案: D

解題說明:

The script shown is written in Terraform, which is an infrastructure as code (IaC) tool used for building, changing, and versioning infrastructure safely and efficiently. This particular Terraform script specifies a required provider and its version, the Terraform version, sets the cloud provider's region, and then defines a resource for a server instance with a specific AMI ID and instance type. It also includes tags for the instance.

The action this script will perform is to create a new cloud resource, specifically a server instance on the cloud provider's platform. References: CompTIA Cloud+ Study Guide (Exam CV0-004) by Todd Montgomery and Stephen Olson

問題 #49

A CI/CD pipeline is used to deploy VMs to an IaaS environment. Which of the following can be used to harden the operating system once the VM is running?

- A. Git
- B. Kubernetes
- C. Ansible
- D. Docker

答案: C

解題說明:

Ansible can be used to harden the operating system once the VM is running. It is an automation tool that can configure systems, deploy software, and orchestrate more advanced IT tasks such as continuous deployments or zero downtime rolling updates.

問題 #50

A company is running a set of replica containers with image version 1. The company updates the image to version 2 and would like

to replace some of the version 1 images with version 2. During the replacement process, a minimum percentage of version 1 replicas need to be kept running while starting image version 2 containers alongside them. Which of the following deployment methods is best given the company's requirements?

- A. In-place
- B. Upgrading
- **C. Rolling**
- D. Patching

答案： C

解題說明：

A rolling deployment gradually replaces old container replicas with new ones, ensuring a minimum number of the old version remain available while new version containers start, meeting the requirement for continuous availability during the update.

問題 #51

A cloud engineer is troubleshooting an application that consumes multiple third-party REST APIs. The application is randomly experiencing high latency. Which of the following would best help determine the source of the latency?

- A. Configuring an API gateway to track all incoming requests
- **B. Enabling tracing to detect HTTP response times and codes**
- C. Running a flow log on the network to analyze the packets
- D. Configuring centralized logging to analyze HTTP requests

答案： B

解題說明：

Enabling tracing in the application can help determine the source of high latency by providing detailed information on HTTP request and response times, as well as response codes. This can identify which API calls are experiencing delays and contribute to overall application latency, allowing for targeted troubleshooting and optimization.

問題 #52

A company recently adjusted its load-balancer encryption policies to support only TLSv1.3. Soon after the change was made, several customers began reporting they could not access their website. Which of the following is the MOST likely cause of the issue?

- A. The certificate is expired.
- B. The load balancer was misconfigured.
- **C. The customers are using an unsupported OS.**
- D. There is a mismatch between the key and the certificate.

答案： C

解題說明：

TLSv1.3 is a newer version of the Transport Layer Security (TLS) protocol that is not supported by all operating systems. If the customers are using an unsupported OS, they will not be able to connect to the website because their browsers will not be able to negotiate a TLSv1.3 connection.
