Amazon AWS Certified Machine Learning Engineer - Associate Sample Questions (Q113-Q118):

NEW QUESTION # 113

Hotspot Question

A company stores historical data in .csv files in Amazon S3. Only some of the rows and columns in the .csv files are populated. The columns are not labeled. An ML engineer needs to prepare and store the data so that the company can use the data to train ML models.

Select and order the correct steps from the following list to perform this task. Each step should be selected one time or not at all. (Select and order three.)

- Create an Amazon SageMaker batch transform job for data cleaning and feature engineering.
- Store the resulting data back in Amazon S3.
- Use Amazon Athena to infer the schemas and available columns.
- Use AWS Glue crawlers to infer the schemas and available columns.
- Use AWS Glue DataBrew for data cleaning and feature engineering.

Answer:

NEW QUESTION # 114

An ML engineer needs to use AWS services to identify and extract meaningful unique keywords from documents. Which solution will meet these requirements with the LEAST operational overhead?

- A. Use Amazon SageMaker and the BlazingText algorithm. Apply custom pre-processing steps for stemming and removal of stop words. Calculate term frequency-inverse document frequency (TF-IDF) scores to identify and extract relevant keywords.
- B. Use the Natural Language Toolkit (NLTK) library on Amazon EC2 instances for text pre-processing. Use the Latent Dirichlet Allocation (LDA) algorithm to identify and extract relevant keywords.
- C. Store the documents in an Amazon S3 bucket. Create AWS Lambda functions to process the documents and to run Python scripts for stemming and removal of stop words. Use bigram and trigram techniques to identify and extract relevant keywords.
- **D. Use Amazon Comprehend custom entity recognition and key phrase extraction to identify and extract relevant keywords.**

Answer: D

Explanation:

Amazon Comprehend provides pre-built functionality for key phrase extraction and can identify meaningful keywords from documents with minimal setup or operational overhead. It eliminates the need for manual preprocessing, stemming, or stop-word removal and does not require custom model development or infrastructure management. This makes it the most efficient and low-maintenance solution for the task.

NEW QUESTION # 115

A company is creating an application that will recommend products for customers to purchase.

The application will make API calls to Amazon Q Business. The company must ensure that responses from Amazon Q Business do not include the name of the company's main competitor.

Which solution will meet this requirement?

- **A. Configure the competitor's name as a blocked phrase in Amazon Q Business.**
- B. Configure document attribute boosting in Amazon Q Business to deprioritize the competitor's name.
- C. Configure an Amazon Q Business retriever to exclude the competitor's name.
- D. Configure an Amazon Kendra retriever for Amazon Q Business to build indexes that exclude the competitor's name.

Answer: A

NEW QUESTION # 116

A company has an application that uses different APIs to generate embeddings for input text. The company needs to implement a solution to automatically rotate the API tokens every 3 months.

Which solution will meet this requirement?

- A. Store the tokens in AWS Key Management Service (AWS KMS). Use an AWS managed key to perform the rotation.
- B. Store the tokens in AWS Key Management Service (AWS KMS). Use an AWS owned key to perform the rotation.
- C. Store the tokens in AWS Systems Manager Parameter Store. Create an AWS Lambda function to perform the rotation.
- **D. Store the tokens in AWS Secrets Manager. Create an AWS Lambda function to perform the rotation.**

Answer: D

Explanation:

AWS Secrets Manager is designed for securely storing, managing, and automatically rotating secrets, including API tokens. By configuring a Lambda function for custom rotation logic, the solution can automatically rotate the API tokens every 3 months as required. Secrets Manager simplifies secret management and integrates seamlessly with other AWS services, making it the ideal choice for this use case.

NEW QUESTION # 117

A company is planning to use Amazon SageMaker to make classification ratings that are based on images. The company has 6 GB of training data that is stored on an Amazon FSx for NetApp ONTAP system virtual machine (SVM). The SVM is in the same VPC as SageMaker.

An ML engineer must make the training data accessible for ML models that are in the SageMaker environment.

Which solution will meet these requirements?

- **A. Mount the FSx for ONTAP file system as a volume to the SageMaker Instance.**
- B. Create an Amazon S3 bucket. Use Mountpoint for Amazon S3 to link the S3 bucket to the FSx for ONTAP file system.
- C. Create a direct connection from SageMaker Data Wrangler to the FSx for ONTAP file system.
- D. Create a catalog connection from SageMaker Data Wrangler to the FSx for ONTAP file system.

Answer: A
