Platform Developer II (PDII) PDF dumps are the third and most convenient format of the Platform Developer II (PDII) PDF questions prep material. This format is perfect for busy test takers who prefer to study for the Platform Developer II (PDII) exam on the go. Questions bank in the Itcertkey Salesforce PDII Pdf Dumps is accessible via all smart devices. We also update Platform Developer II (PDII) PDF questions regularly to ensure they match with the new content of the PDII exam.

Salesforce PDII exam is intended for experienced Salesforce developers who have already passed the Salesforce Certified Platform Developer I exam. The PDII exam is a challenging test that requires developers to have a deep understanding of Salesforce development best practices and advanced programming concepts. PDII Exam includes a mix of multiple-choice questions and hands-on coding challenges that test the developer's ability to design and develop complex solutions on the Salesforce platform.

## Certificate Salesforce PDII Exam, Pdf PDII Pass Leader

It is difficult to get the PDII certification for you need have extremely high concentration to have all test sites in mind. Our PDII learning questions can successfully solve this question for the content are exactly close to the changes of the real exam. When you grasp the key points, nothing will be difficult for you anymore. Our professional experts are good at compiling the PDII training guide with the most important information. Believe in us, and your success is 100% guaranteed!

Salesforce Certified Platform Developer II (PDII) exam is a challenging certification that measures your ability to design and develop custom solutions using Apex and Visualforce. Platform Developer II certification is intended for experienced developers who have a deep understanding of Salesforce's architecture and API capabilities. Passing the PDII Exam demonstrates your proficiency in developing complex business solutions on the Salesforce platform and can help you advance your career as a Salesforce developer.

## Salesforce Platform Developer II Sample Questions (Q61-Q66):

### NEW QUESTION # 61

A developer created an Opportunity trigger that updates the account rating when an associated opportunity is considered high value. Current criteria for an opportunity to be considered high value is an amount greater than or equal to \$1,000,000. However, this criteria value can change over time. There is a new requirement to also display high value opportunities in a Lightning web component. Which two actions should the developer take to meet these business requirements, and also prevent the business logic that obtains the high value opportunities from being repeated in more than one place?2021

- A. Leave the business logic code inside the trigger for efficiency.23
- B. Create a helper class that fetches the high value opportunities.

- C. Call the trigger from the Lightning web25 component.
- D. Use custom metadata to hold the high value amount.<sup>24</sup>

**Answer: B,D**

Explanation:

To build a maintainable and scalable solution, a developer must separate business logic from trigger execution and avoid hard-coding threshold values.

First, the \$1,000,000 threshold should be stored in Custom Metadata (Option B). Custom Metadata is superior to hard-coding or even Custom Settings in this context because the records are deployable and can be queried efficiently without counting against standard SOQL limits. If the business decides to lower the "high value" threshold to \$500,000, an administrator can simply update the Custom Metadata record without requiring any code changes or redeployments.

Second, the logic to identify these opportunities should be moved to a Helper Class (Option D). This follows the "Separation of Concerns" principle. Instead of writing the SOQL query and logic inside the trigger, the trigger calls a method in the helper class. Similarly, the Lightning Web Component's Apex controller can call the exact same method in the helper class. This ensures that the definition of a "high value opportunity" is managed in one single place in the codebase. If the logic becomes more complex (e.g., adding Industry filters), the developer only needs to update the helper class once to satisfy both the trigger and the UI component. Option A leads to "spaghetti code," and Option C is impossible as triggers cannot be called directly from JavaScript or other Apex classes.

### NEW QUESTION # 62

A lead developer for a Salesforce organization needs to develop a page-centric application that allows the user to interact with multiple objects related to a Contact. The application needs to implement a third-party JavaScript framework such as Angular, and must be made available in both Classic and Lightning Experience.

Given these requirements, what is the recommended solution to develop the application?

- A. Lightning Web Components
- B. Visualforce
- C. Aura Components
- D. Lightning Experience Builder

**Answer: D**

### NEW QUESTION # 63

An org has a requirement that an Account must always have one and only one Contact listed as Primary. So selecting one Contact will de-select any others. The client wants a checkbox on the Contact called 'Is Primary' to control this feature.

The client also wants to ensure that the last name of every Contact is stored entirely in uppercase characters.

What is the optimal way to implement these requirements?

- A. Write an after update trigger on Contact for the Is Primary logic and a separate before update trigger on Contact for the last name logic.
- B. Write a single trigger on Contact for both after update and before update and callout to helper classes to handle each set of logic.
- C. Write a Validation Rule on the Contact for the Is Primary logic and a before update trigger on Contact for the last name logic.
- D. Write an after update trigger on Account for the Is Primary logic and a before update trigger on Contact for the last name logic.

**Answer: B**

Explanation:

A single trigger on Contact that handles both after update and before update events, utilizing helper classes for each logic set, is the most optimal implementation. It centralizes the logic for maintaining primary contacts and normalizing last names while allowing for clear separation of concerns through helper classes. References:

### NEW QUESTION # 64

A developer needs to add code to a Lightning web component's configuration file so the component only renders for a desktop size form factor when on a record page.

What should the developer add to the component's record page target configuration to meet this requirement?

- A.
- B.
- C.
- D.

**Answer: B**

Explanation:

When you want a Lightning web component to only render for a specific form factor, you can use the <targets> tag within the component's .xml configuration file. To specify that the component should only appear on a desktop, you use the <targetConfig> tag with the targets="lightning\_RecordPage" attribute and nest a <supportedFormFactors> tag inside it. Within this tag, you include a <supportedFormFactor> tag with the attribute type="Large".

Option B is the correct markup to ensure that the component only appears for the desktop form factor on a record page.

### NEW QUESTION # 65

A developer is asked to develop a new AppExchange application. A feature of the program creates Survey records when a Case reaches a certain stage and is of a certain Record Type. This feature needs to be configurable, as different Salesforce instances require Surveys at different times. Additionally, the out-of-the-box AppExchange app needs to come with a set of best practice settings that apply to most customers.

What should the developer use to store and package the custom configuration settings for the app?

- A. Process Builder
- B. Custom Metadata
- C. Custom Settings
- D.  Custom Objects

**Answer: D**
