I believe that you are willing to chat with a friendly person. All of SPLK-3002 Learning Materials do this to allow you to solve problems in a pleasant atmosphere while enhancing your interest in learning.

Splunk IT Service Intelligence Certified Admin Sample Questions (Q76-Q81):

NEW QUESTION # 76

When must a service define entity rules?

- A. If the intention is for the KPIs in the service to have different aggregate vs. entity KPI values.
- **B. If the intention is for the KPIs in the service to filter to only entities assigned to the service.**
- C. If some or all of the KPIs in the service will be split by entity.
- D. To enable entity cohesion anomaly detection.

Answer: B

Explanation:

Provide a value to filter the service to a specific set of entities. These entity rule values are meant to be custom for each service.

Reference:

A is the correct answer because a service must define entity rules if the intention is for the KPIs in the service to filter to only entities assigned to the service. Entity rules are filters that match entities to services based on entity aliases or entity metadata. If you enable the Filter to Entities in Service option for a KPI, you need to define entity rules for the service to ensure that the KPI search results only include the relevant entities for the service. Otherwise, the KPI search results might include entities that are not part of the service or exclude entities that are part of the service. Reference: [Define entities for a service in ITSI], [Configure KPI settings in ITSI]

NEW QUESTION # 77

What is the main purpose of the service analyzer?

- **A. Monitor overall Service and KPI status.**
- B. Allow Analysts to add comments to Alerts.
- C. Display a list of All Services and Entities.
- D. Trigger external alerts based on threshold violations.

Answer: A

Explanation:

Reference: <https://docs.splunk.com/Documentation/MSExchange/4.0.3/Reference/ServiceAnalyzer> The service analyzer is a dashboard that allows you to monitor the overall service and KPI status in ITSI. The service analyzer displays a list of all services and their health scores, which indicate how well each service is performing based on its KPIs. You can also view the status and values of each KPI within a service, as well as drill down into deep dives or glass tables for further analysis. The service analyzer helps you identify issues affecting your services and prioritize them based on their impact and urgency. The main purpose of the service analyzer is:

D). Monitor overall service and KPI status. This is true because the service analyzer provides a comprehensive view of the health and performance of your services and KPIs in real time.

The other options are not the main purpose of the service analyzer because:

A). Display a list of all services and entities. This is not true because the service analyzer does not display entities, which are IT components that require management to deliver an IT service. Entities are displayed in other dashboards, such as entity management or entity health overview.

B). Trigger external alerts based on threshold violations. This is not true because the service analyzer does not trigger alerts, which are notifications sent to external systems or users when certain conditions are met. Alerts are triggered by correlation searches or alert actions configured in ITSI.

C). Allow analysts to add comments to alerts. This is not true because the service analyzer does not allow analysts to add comments to alerts, which are notifications sent to external systems or users

NEW QUESTION # 78

ITSI Saved Search Scheduling is configured to use `realtime_schedule = 0`. Which statement is accurate about this configuration?

- A. If this value is set to 0, the scheduler may skip scheduled execution periods.
- **B. If this value is set to 0, the scheduler bases its determination of the next scheduled search on the last search execution time.**
- C. If this value is set to 0, the scheduler might skip some execution periods to make sure that the scheduler is executing the searches running over the most recent time range.
- D. If this value is set to 0, the scheduler bases its determination of the next scheduled search execution time on the current time.

Answer: B

Explanation:

ITSI Saved Search Scheduling is a feature that allows you to schedule searches that run periodically to populate the data for your KPIs. You can configure various settings for your scheduled searches, such as the search frequency, the time range, the cron expression, and so on. One of the settings is `realtime_schedule`, which controls the way the scheduler computes the next execution time of a scheduled search. The statement that is accurate about this configuration is:

B) If this value is set to 0, the scheduler bases its determination of the next scheduled search on the last search execution time. This is called continuous scheduling. If set to 0, the scheduler never skips scheduled execution periods. However, the execution of the saved search might fall behind depending on the scheduler's load. Use continuous scheduling whenever you enable the summary index option.

The other statements are not accurate because:

- A) If this value is set to 0, the scheduler bases its determination of the next scheduled search execution time on the current time. This is not true because this is what happens when the value is set to 1, not 0.
- C) If this value is set to 0, the scheduler may skip scheduled execution periods. This is not true because this is what happens when the value is set to 1, not 0.
- D) If this value is set to 0, the scheduler might skip some execution periods to make sure that the scheduler is executing the searches running over the most recent time range. This is not true because this is what happens when the value is set to 1, not 0.

NEW QUESTION # 79

Where are KPI search results stored?

- A. The **itsi_summary index**.
- B. The default index.
- C. KV Store.
- D. Output to a CSV lookup.

Answer: A

Explanation:

Explanation

Search results are processed, created, and written to the itsi_summary index via an alert action.

NEW QUESTION # 80

Anomaly detection can be enabled on which one of the following?

- A. Multi-KPI alert
- B. **KPI**
- C. Service
- D. Entity

Answer: B

Explanation:

A is the correct answer because anomaly detection can be enabled on a KPI level in ITSI. Anomaly detection allows you to identify trends and outliers in KPI search results that might indicate an issue with your system.

You can enable anomaly detection for a KPI by selecting one of the two anomaly detection algorithms in the KPI configuration panel. References: Apply anomaly detection to a KPI in ITSI

NEW QUESTION # 81

.....

Our company committed all versions of SPLK-3002 practice materials attached with free update service. When SPLK-3002 exam preparation has new updates, the customer services staff will send you the latest version.
