Valid Appian Reliable Guide Files – High-quality Regualer ACD201 Update

We provide free PDF demo for each exam. This free demo is a small part of the official complete Appian ACD201 training dumps. The free demo can show you the quality of our exam materials. You can download any time before purchasing. You can tell if our products and service have advantage over others. I believe our Appian ACD201 training dumps will be the highest value with competitive price comparing other providers.

Appian Senior Developer Sample Questions (Q34-Q39):

NEW QUESTION # 34

You're designing a custom component rule!pagingComponent() to page through a list of items. The component must display the current page numbers being shown, as well as the total number of items. Users should be able to click arrows to increase or decrease the pagination.

Review the following:

```

allocalVariables(
  local!query: rule!getData(),
  {
    rule!interface(),
    rule!pagingComponent()
  }
)

```

Which two patterns should be used when calling the component in this scenario? (Choose two.)

- A. A rule input ri!pagingInfo on rule!pagingComponent() with a local variable of the same name in the main interface with an initial value. When the arrows are clicked, this updates the value of the local variable in the main interface.
- B. A local variable local!pagingInfo inside rule!pagingComponent() with an initial value. When the arrows are clicked, this updates the value of the local variable.
- C. Passing into the rule input totalCount of rule!pagingComponent() the value: local!query.totalCount where local!query is returning a dataSubset and returnTotalCount = "True".
- D. A local variable local!totalCount calculated using count(local!query), which is passed into rule!pagingComponent() via a rule input. The data type of local!query is a list of record or Custom Data Type (CDT).

Answer: A,C

Explanation:

Passing local!query.totalCount (from a dataSubset with returnTotalCount: true) into a rule input allows rule!pagingComponent() to accurately display total items for pagination.

Managing paging state (such as ri!pagingInfo) as a local variable in the main interface and updating it when arrows are clicked ensures that pagination is controlled centrally, maintaining state across the UI and allowing the component to function as intended.

NEW QUESTION # 35

The synced record Task has a self-referential relationship defined in the column parentTaskId. There is a many-to-one record relationship between the id and parentTaskId called parentTask.

For a given task ID, you need to return the task name and the parent task name.

What should you do?

- A. Create a sync-time custom record field on the Task record called parentName. Specify this field to return in the query field selection.
- B. Use a!queryRecordType() filtered on the task id once to return the task name and parent task ID. Query the record again to return the parent task name.
- C. Use a!queryRecordType() with a filter on the task id, with fields specified to return recordType!Task.name and recordType!Task.parentTask.name.

Answer: C

Explanation:

Using a!queryRecordType() with a filter on the task ID and specifying both recordType!Task.name and recordType!Task.parentTask.name in the fields will efficiently return both the task name and its parent task name in a single query.

NEW QUESTION # 36

You're conducting a code review and notice that some accessibility features are missing on the interfaces. Which two UX best practices should be followed to align with accessibility requirements? (Choose two.)

- A. Indicate the hierarchy of sections with a heading tag in addition to label sizes (for example: "H1").
- B. Use a single rich text icon with "POSITIVE" or "NEGATIVE" styling to indicate statuses.
- C. Apply a label value for all fields when the label position is "Hidden".
- D. Use rich text items to act as headers for structuring interfaces.

Answer: A,C

Explanation:

Applying a label value for all fields, even when the label position is hidden, ensures screen readers and assistive technologies can interpret the field correctly.

Indicating the hierarchy of sections with heading tags improves navigation for users with assistive technologies, aligning with accessibility standards.

NEW QUESTION # 37

You need to create a web API so that an external system can start a process in your app. Which two statements are true about using a service account to authenticate the system? (Choose two.)

- A. The service account must be a user in the Service Accounts group.
- B. The service account must be configured from within the web API object.
- C. The service account must be granted access to that web API via group management.
- D. The service account is created as any other object in Appian.

Answer: A,C

Explanation:

The service account must be granted access to the web API, typically via group management, to allow authenticated calls.

The service account must be a user in the Service Accounts group to be used for authentication in integrations such as web APIs.

NEW QUESTION # 38

You're configuring Health Check settings under the Admin Console.

Which section would you find the setting to indicate that the Health Check will run on a Production Environment?

- A. Scheduling
- B. General
- C. Automatic Upload

Answer: C

Explanation:

The Automatic Upload section in the Health Check settings of the Admin Console includes the option to indicate that the Health Check is running on a Production Environment, which helps Appian appropriately analyze and benchmark the data.
