

100% Pass Saviynt - SCAIP–Trustable Exam Papers

The smartest way of getting high passing score in SCAIP valid test is choosing latest and accurate certification learning materials. The up-to-date SCAIP exam answers will save you from wasting much time and energy in the exam preparation. The content of our SCAIP Dumps Torrent covers the key points of exam, which will improve your ability to solve the difficulties of SCAIP real questions. Just add our exam dumps to your cart to get certification.

Saviynt SCAIP Exam Syllabus Topics:

Topic	Details
Topic 1	Building Identity Warehouse: This section covers setting up the foundation of Saviynt by importing users, onboarding applications, and managing roles and access within the identity warehouse.
Topic 2	Analytics: This section focuses on building, configuring, and delivering reports, analytic controls, and dashboards to support data-driven identity governance decisions.
Topic 3	Access Request System: This section focuses on configuring and managing the end-to-end access request process, including workflows, approvals, and provisioning for both connected and disconnected applications.

Pass Guaranteed Trustable Saviynt - SCAIP - Exam Saviynt Certified Advanced IGA Professional (Level 200) Papers

The TestkingPDF SCAIP PDF questions file, desktop practice test software, and web-based practice test software, all these three SCAIP practice test questions formats are ready for instant download. Just download any Saviynt SCAIP Exam Questions format and start this journey with confidence.

Saviynt Certified Advanced IGA Professional (Level 200) Sample Questions (Q56-Q61):

NEW QUESTION # 56

Which HTTP method or methods is used to generate an Authorization Token for Saviynt EIC API?

- A. GIVE
- B. POST
- C. GET
- D. PUT

Answer: B

Explanation:

In Saviynt EIC, generating an Authorization Token for API access is performed using the HTTP POST method.

This is aligned with standard REST API authentication practices, where sensitive information such as credentials (username, password, client ID, or client secret) is securely transmitted in the request body rather than in the URL.

Saviynt provides API endpoints (such as /ECM/api/login) that require a POST request containing authentication details in JSON format. Upon successful authentication, the system returns a session token or authorization token, which is then used in subsequent API calls (typically passed in headers like Authorization or token).

Option A (PUT) and Option B (GET) are not suitable for authentication token generation. GET exposes parameters in the URL and is not secure for credential transmission, while PUT is typically used for updating resources. Option D (GIVE) is not a valid HTTP method.

Therefore, POST is the correct and secure method used in Saviynt APIs for authentication and token generation, ensuring compliance with RESTful and security best practices.

NEW QUESTION # 57

A target application exposes REST APIs and you need Saviynt to perform imports as well as provisioning and deprovisioning. Which connector approach is the most appropriate?

- A. Dataset Configuration
- B. Active Directory Connector
- C. SMTP Configuration
- **D. REST Connector**

Answer: D

Explanation:

The correct answer is B. REST Connector. Saviynt documentation explains that REST integration is intended for applications whose data and lifecycle actions are available through REST endpoints. It states that the REST integration enables organizations to gain visibility, manage the user lifecycle, and govern access for data available in the REST application or REST endpoint. That directly matches the question, which requires imports plus provisioning and deprovisioning for an API-driven target system. Saviynt's REST connector documentation also notes that provisioning and deprovisioning are supported when the connection is configured correctly. This makes the REST connector the standard choice when the target system does not use an out-of-the-box native connector but does provide usable REST APIs. The other options do not fit the requirement. Active Directory Connector is specific to AD use cases, SMTP Configuration is only for email delivery, and Dataset Configuration is an administrative data-structuring feature rather than an application integration method. In Saviynt Level 200 terms, when an application is API-first and lifecycle actions must be automated, the REST connector is the appropriate design decision.

NEW QUESTION # 58

The EIC administrator has a requirement for integrating EIC with ServiceNow as a ticketing system, where end users should be able to check the status of associated tickets in ServiceNow from EIC. What option can the administrator utilize to fulfill this requirement?

- A. It is not possible to check the status of ticket in ServiceNow
- B. CREATETICKETJSON
- C. SYNCTICKETSTATUSJSON
- **D. TICKETSTATUSJSON**

Answer: D

Explanation:

In Saviynt EIC integration with ServiceNow as a ticketing system (ITSM), various JSON configurations are used to define how tickets are created, updated, and tracked. To enable users to check the status of tickets from EIC, the correct configuration is TICKETSTATUSJSON.

TICKETSTATUSJSON is specifically used to define how Saviynt retrieves the current status of a ticket from ServiceNow. It maps the API response fields from ServiceNow (such as state, status, or resolution) to Saviynt fields, allowing the system to display real-time ticket status within the EIC interface.

Option A (SYNCTICKETSTATUSJSON) is typically used for synchronization jobs that update ticket statuses in bulk, not for direct user-level status retrieval. Option B (CREATETICKETJSON) is used only for ticket creation, defining how requests are sent to ServiceNow. Option D is incorrect because Saviynt does support ticket status tracking through proper integration configuration. Thus, TICKETSTATUSJSON is the correct option to enable visibility of ticket status within Saviynt EIC.

NEW QUESTION # 59

In EIC, how is the accountname for the service account created? (Multi-Select)

- A. Enter Manually while requesting a service account
- B. As defined in Endpoint - > Service Account Name Rule
- C. As defined in Global Configurations - > Account Name Rule
- D. As defined in Connection - > Create Account JSON

Answer: B,D

Explanation:

In Saviynt EIC, the service account name generation is controlled through configuration-driven mechanisms to ensure consistency, automation, and compliance with naming standards.

Option A is correct because administrators can define naming conventions at the Endpoint level using the Service Account Name Rule. This allows dynamic generation of account names based on attributes such as application name, environment, or other identifiers, ensuring standardized naming across systems.

Option D is also correct since in many connector-based integrations, the Create Account JSON configuration plays a role in provisioning. The account name can be derived or constructed within this JSON payload based on defined mappings and logic, especially for REST or custom connectors.

Option B is incorrect because service account creation in Saviynt is typically controlled and standardized; manual entry of account names is generally restricted or governed to avoid inconsistencies. Option C is incorrect because Global Configurations do not directly define service account naming rules in standard implementations.

Thus, the correct answers are Endpoint-based naming rules and Connection-level JSON configuration, ensuring automated and consistent service account naming.

NEW QUESTION # 60

EIC is configured to create tickets in ServiceNow for requests for disconnected applications. The end user selects 3 different entitlements for a disconnected application and submits the request. How will EIC process this request?

- A. EIC will combine all three entitlements and create one ticket in ServiceNow
- B. EIC will create three separate tickets in ServiceNow, one for each of the three entitlements
- C. If the "Enable Multi Entitlement Request" option is selected, then three tickets will be created in ServiceNow; otherwise, only one ticket will be created
- D. Not a valid scenario because EIC does not support multiple entitlement requests when ServiceNow is integrated as the ticketing system

Answer: C

Explanation:

In Saviynt EIC when integrated with ServiceNow as a ticketing system (ITSM) for disconnected applications, ticket creation behavior depends on the configuration setting "Enable Multi Entitlement Request." If this option is enabled, Saviynt treats each entitlement independently and creates separate tickets in ServiceNow for each entitlement selected in the request. Therefore, if a user selects three entitlements, three individual tickets will be generated, allowing granular tracking and fulfillment of each entitlement.

If the option is not enabled, Saviynt consolidates multiple entitlements into a single request payload, resulting in one ServiceNow ticket that includes all requested entitlements. This approach simplifies ticket management but reduces granularity.

Option B is incorrect because Saviynt fully supports multiple entitlement requests with ServiceNow integration. Option C is only conditionally correct (depends on configuration), making it incomplete. Option D is also conditional and not always true.

Thus, the correct answer is A, as it accurately reflects the behavior based on system configuration.

NEW QUESTION # 61

.....

The best strategy to enhance your knowledge and become accustomed to the SCAIP Exam Questions format is to test yourself. TestkingPDF Saviynt SCAIP practice tests (desktop and web-based) assist you in evaluating and enhancing your knowledge, helping you avoid viewing the Saviynt test as a potentially daunting experience. If the reports of your Saviynt practice exams (desktop and online) aren't perfect, it's preferable to practice more. SCAIP self-assessment tests from TestkingPDF works as a wake-up call, helping you to strengthen your SCAIP preparation ahead of the Saviynt actual exam.
