UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q38-Q43):

NEW QUESTION # 38

Which of the following best describes a human-in-the-loop automation model?

- A. Users control the robot's every action in real time
- B. Robots only work when manually triggered
- C. Robots run independently without user input
- D. Unattended robots request user input at certain steps

Answer: D

Explanation:

In a human-in-the-loop automation model, unattended robots perform processes automatically but pause and request user input when required. This model allows robots to handle repetitive and rule-based tasks while humans intervene in scenarios that require decision-making or approval.

UiPath supports human-in-the-loop functionality using tools such as UiPath Action Center, where users can review exceptions, provide additional data, or make business decisions. Once the input is received, the automation resumes and completes the rest of the process autonomously.

This model is particularly useful for processes involving compliance checks, approvals, or document verification - blending the speed of automation with human judgment where necessary.

NEW QUESTION # 39

Which document captures the initial agreement on scope, timelines, and responsibilities between client and implementation teams?

- A. Statement of Work (SOW)
- B. Process Definition Document (PDD)
- C. Project Plan
- D. UAT Plan

Answer: A

Explanation:

The Statement of Work (SOW) captures the initial agreement between the Client Team and the Implementation Team. It defines the high-level scope, project timelines, responsibilities, deliverables, and engagement terms for the automation project.

The SOW is usually prepared before or during the Kickoff stage and serves as the formal agreement that sets expectations for all stakeholders. It provides clarity on:

- * What is to be delivered
- * By when
- * By whom
- * Under what conditions

Having a well-defined SOW is essential to avoid scope creep, timeline mismanagement, or resource conflicts. It also helps align both parties and acts as a reference point throughout the project's lifecycle.

NEW QUESTION # 40

What is the primary purpose of the Process Assessment Tool in UiPath?

- A. Determining process fit and feasibility for automation
- B. Designing automated workflows
- C. Tracking project defects
- D. Managing robot workloads

Answer: A

Explanation:

The Process Assessment Tool in UiPath is designed to evaluate whether a business process is a good fit for automation. It assists business analysts and other stakeholders in determining both the feasibility and the value of automating a specific process.

The tool assesses various dimensions such as process complexity, frequency, standardization, exception handling, and potential business impact. Based on this evaluation, the tool generates a score or categorization that helps prioritize processes for automation. This helps organizations invest their automation efforts in the right areas - those that offer high ROI and are technically viable. It also enables strategic decision-making in the Discover phase, where automation candidates are initially shortlisted and analyzed.

NEW QUESTION # 41

What does the Applications errors & exceptions handling sub-section of the PDD include?

- A. A list of all errors, warnings and notifications that occurred during process discovery
- B. A list of all errors, warnings and notifications that occurred during testing
- C. A list of all errors, warnings and notifications that occurred before the automation implementation
- D. **A list of all errors, warnings and notifications with actions to be taken for each by the robot**

Answer: D

Explanation:

The Applications Errors & Exceptions Handlingsub-section of theProcess Definition Document (PDD) includes a list of all known errors, warnings, and notifications that may occur during the execution of the process, along with theexpected actions the robot should take in response.

This section is essential for preparing the automation to handle real-world scenarios gracefully. For example, if a login fails, a system is down, or a specific field is empty, the robot must know whether to:

- * Retry the action
- * Log the error and continue
- * Escalate the issue
- * Halt execution and notify the user

These instructions are defined during theProcess Analysis stage, often based on historical error logs and SME input. Including these error-handling rules in the PDD ensures that developers build automation that is resilient,robust, and capable of handling unexpected conditions during runtime.

Without this section, robots may fail unpredictably or behave inconsistently, leading to errors in production.

This documentation helps ensure automation is not only functional but also stable and reliablein the long term.

NEW QUESTION # 42

What is the key responsibility of the Client Team Project Manager?

- A. Overseeing infrastructure installation and configuration
- B. Writing automation code in UiPath Studio
- C. Creating the Solution Design Document
- D. **Managing internal client-side processes and escalations**

Answer: D

Explanation:

TheClient Team Project Manageris responsible for managing internal client-side processes and handling escalationsduring the implementation lifecycle. This role acts as the client's primary liaison with the Implementation Team and ensures that internal dependencies and commitments are met.

Responsibilities include:

- * Coordinating Subject Matter Experts (SMEs) and business stakeholders
- * Communicating internal timelines and availability
- * Facilitating approval processes for documents and deliverables
- * Escalating and resolving client-side roadblocks
- * Ensuring that the client team is aligned with project expectations

Their involvement ensures that the implementation proceeds without delays caused by unavailability, access issues, or lack of communication from the client side.
