ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q92-Q97):

NEW QUESTION # 92

Which of the following statements about white-box test techniques is true?

- **A. Code-related white-box test techniques provide an objective measure of coverage and can be used to complement black-box test techniques to increase confidence in the code**
- B. Branch coverage is the most thorough code-related white-box test technique, and therefore applicable standards prescribe achieving full branch coverage at the highest safety levels for safety-critical systems
- C. Code-related white-box test techniques are not required to measure the actual code coverage achieved by black-box testing, as code coverage can be measured using the coverage criteria associated with black-box test techniques
- D. Achieving full statement coverage and full branch coverage for a software product means that such software product has been fully tested and there are no remaining bugs within the code

Answer: A

Explanation:

This answer is correct because code-related white-box test techniques are test design techniques that use the structure of the code to derive test cases. They provide an objective measure of coverage, such as statement coverage, branch coverage, or path coverage, which indicate how much of the code has been exercised by the test cases. Code-related white-box test techniques can be used to complement black-box test techniques, which are test design techniques that use the functional or non-functional requirements of the system or component to derive test cases. By combining both types of techniques, testers can increase their confidence in the code and find more defects. NEW QUESTION # 93

You are a tester working on a critical project. Based on the risk analysis you need to decide on the order of test execution. Which of the following lists the correct sequence of test execution? Priority 1 is the highest and Priority 3 is the lowest priority.

Test CasePriorityDependencies

Test A3-

Test B1TestD

TestC2Test A

Test D3*

- A. C-B-A-D
- **B. D-B-A-C**
- C. D-A-B-C
- D. D-C- B-A

Answer: B

Explanation:

When deciding on the order of test execution based on priorities and dependencies, the correct sequence should consider both the priority levels and any dependencies between test cases. Here's the analysis:

* Test B has the highest priority (1) and depends on Test D.

* Test D should be executed before Test B.

* Test C has a medium priority (2) and depends on Test A.

* Test A can be executed at any time since it has no dependencies.

Considering these dependencies and priorities, Test D should be executed first, followed by Test B. After that, Test A and finally Test C. Therefore, the correct sequence is D-B-A-C.

NEW QUESTION # 94

Which ONE of the following options corresponds to an activity in the testing process in which testable features are identified?

- A. Test analysis
- B. Test implementation
- C. Test execution
- D. Test design

Answer: A

Explanation:

Test analysis involves identifying the features to be tested and deriving test conditions. It is the phase where testers analyze the test basis (e.g., requirements, specifications) to identify testable aspects of the system. Test design (A) focuses on creating test cases, test implementation (C) involves preparing the test environment, and test execution (D) runs the tests.

NEW QUESTION # 95

Which ONE of the following activities TYPICALLY belongs to the planning phase of the review process?

- A. Each reviewer conducts an individual review to identify anomalies, recommendations, and questions.
- B. A separate defect report is created for each identified defect so that corrective actions can be tracked.
- C. The purpose and scope of the review are defined, as well as the work product to be reviewed and the exit criteria.
- D. The reviewers analyze and discuss the anomalies found during the review in a joint meeting.

Answer: C

Explanation:

The planning phase of the review process (C) includes defining the review's purpose, scope, and exit criteria to ensure alignment. Option A is part of the defect management phase, B happens during individual preparation, and D takes place in the review meeting.

NEW QUESTION # 96

What type of testing measures its effectiveness by tracking which lines of code were executed by the tests?

- A. Acceptance testing
- B. Exploratory testing
- C. Integration testing
- D. Structural testing

Answer: D

Explanation:

Structural testing is a type of testing that measures its effectiveness by tracking which lines of code were executed by the tests. Structural testing, also known as white-box testing or glass-box testing, is based on the internal structure, design, or implementation of the software. Structural testing aims to verify that the software meets the specified quality attributes, such as performance, security, reliability, or maintainability, by exercising the code paths, branches, statements, conditions, or data flows. Structural testing uses various coverage metrics, such as function coverage, line coverage, branch coverage, or statement coverage, to determine how much of the code has been tested and to identify any untested or unreachable parts of the code. Structural testing can be applied at any level of testing, such as unit testing, integration testing, system testing, or acceptance testing, but it is more commonly used at lower levels, where the testers have access to the source code.

The other options are not correct because they are not types of testing that measure their effectiveness by tracking which lines of code were executed by the tests. Acceptance testing is a type of testing that verifies that the software meets the acceptance criteria and the user requirements. Acceptance testing is usually performed by the end-users or customers, who may not have access to the source code or the technical details of the software. Acceptance testing is more concerned with the functionality, usability, or suitability of the software, rather than its internal structure or implementation. Integration testing is a type of testing that verifies that the software components or subsystems work together as expected. Integration testing is usually performed by the developers or testers, who may use both structural and functional testing techniques to check the interfaces, interactions, or dependencies between the components or subsystems. Integration testing is more concerned with the integration logic, data flow, or communication of the software, rather than its individual lines of code. Exploratory testing is a type of testing that involves simultaneous learning, test design, and test execution. Exploratory testing is usually performed by the testers, who use their creativity, intuition, or experience to explore the software and discover any defects, risks, or opportunities for improvement. Exploratory testing is more concerned with

the behavior, quality, or value of the software, rather than its internal structure or implementation.
