In addition, SAFe-Practitioner training materials of us are high quality, and you just need to spend 48 to 72 hours on practicing, and you can pass the exam successfully. If you have any questions about the SAFe-Practitioner Exam Dumps, just contact us, we will give you reply as soon as possible.

Scrum SAFe Practitioner Exam (6.0) Sample Questions (Q199-Q204):

NEW QUESTION # 199

Which of the following statements describes the concept of "shift-left"?

- A. Write tests at the end of development to capture potential failures discovered throughout the development process
- B. Run two nearly identical production environments, moving users between the two to make small changes to one or the other
- **C. Move testing and validation activities earlier in the work cycle to get faster or continuous feedback**
- D. Perform testing and validation activities in the production environment under real-world conditions

Answer: C

Explanation:

The concept of "shift-left" means moving testing and validation activities earlier in the work cycle to get faster or continuous feedback. This helps to identify and fix defects, errors, or issues as soon as possible, reducing the cost and risk of rework and delays. Shift-left testing also supports the agile principle of delivering working software frequently and the lean principle of building quality in. By shifting testing left, teams can ensure that the solutions they deliver meet the customer needs and expectations, as well as the quality standards and compliance requirements. References: Built-In Quality, Shift Left Testing: What, Why & How To Shift Left, What Executives Should Know About Shift-Left Security, What is Shift Left Security?

NEW QUESTION # 200

What visibility should Scrum Masters provide during the Agile Release Train Sync?

- A. Visibility into system Solution Intent
- **B. Visibility into progress and impediments**
- C. Visibility into single source design decisions
- D. Visibility into collaboration deployment

Answer: B

Explanation:

The Agile Release Train Sync is a weekly meeting that synchronizes the ART stakeholders and provides visibility into the ART's progress and impediments¹. The Scrum Masters represent their Agile teams, provide updates on their status, relay questions, and help address challenges. They safeguard the team's needs and effectiveness². The visibility that Scrum Masters provide during the Agile Release Train Sync is mainly into the progress and impediments of their teams, such as the completion of features, stories, and enablers, the resolution of dependencies, the identification of risks and issues, and the demonstration of value³. The other options are not the primary focus of the Scrum Masters' visibility during the Agile Release Train Sync. NEW QUESTION # 201

What is an example of applying cadence-based synchronization in SAFe?

- A. Allocating budgets to Value Streams
- B. Creating cross-functional ARTs and Agile teams
- **C. Conducting a PI Planning event**
- D. Using a Portfolio Kanban system

Answer: C

Explanation:

Conducting a PI Planning event is an example of applying cadence-based synchronization in SAFe. A PI Planning event is a two-day face-to-face or virtual meeting where all the members of an ART and Solution Train collaborate to align on a common vision, mission, and backlog, and plan the work for the next Program Increment (PI). A PI is a fixed timebox of 8 to 12 weeks that provides a regular cadence for delivering value.

The PI Planning event is synchronized across all the teams and trains in the portfolio, and it occurs at the beginning of every PI. The PI Planning event enables the ART and Solution Train to achieve alignment, collaboration, synchronization, and commitment, as well as to identify and address risks and dependencies. NEW QUESTION # 202

Story points are relative. They are not connected to any specific unit of measure.

- A. TRUE
- B. FALSE

Answer: A**NEW QUESTION # 203**

Which statement is true about Features and Stories?

- A. They are prioritized by the team
- B. Features can be larger than an Iteration but Stories should be small enough to fit into an Iteration
- C. They are estimated like User Stories
- D. Features should be small enough to fit into an Iteration

Answer: B

Explanation:

In SAFe, a clear distinction is made between the purpose, structure and content of features, and that of stories (including enablers). Features are visible units of business intent that the customer recognizes, and it's at this level of detail that the customer is able to prioritize their needs¹. Features are maintained in the ART Backlog and sized to fit in a PI so that each delivers new value². Stories are short descriptions of a small piece of desired functionality written from the user's perspective. Stories are the primary artifact used to define system behavior in Agile³. Stories are small and must be completed in a single iteration³. Therefore, features can be larger than an iteration but stories should be small enough to fit into an iteration.
