

Reliable ADA-C01 Exam Prep & Examinations ADA-C01 Actual Questions

What's more, part of that CertkingdomPDF ADA-C01 dumps now are free: <https://drive.google.com/open?id=1nLWrkcRzjXcwjDfdORq-1R-y8WZX-xxV>

In fact, passing ADA-C01 certification exam is just a piece of cake! But in realistic society, some candidates always say that this is difficult to accomplish. Therefore, ADA-C01 certification has become a luxury that some candidates aspire to. When the some candidates through how many years attempted to achieve a goal to get ADA-C01 Certification, had still not seen success hope, candidate thought always depth is having doubts unavoidably bog: can I get ADA-C01 certification? When can I get ADA-C01 certification? In this a succession of question behind, is following close on is the suspicion and lax.

If you feel difficult in choosing which version of our ADA-C01 reliable exam guide, if you want to be simple, PDF version may be suitable for you. PDF version is a normal file. Many candidates are used to printing out and then writing & reading of ADA-C01 reliable exam guide on paper. Yes, it is silent and clear. Also if you have some unclearly questions, you can ask or talk with others easily. Others may just think that it is normally practice material. Also you can print out many copies of Snowflake ADA-C01 Reliable Exam Guide and share with others.

Examinations ADA-C01 Actual Questions - ADA-C01 Reliable Exam Question

If you prefer to practice ADA-C01 study guide on paper, ADA-C01 PDF version will be your best choice. And you can also take some notes on them. ADA-C01 PDF version is printable, and you can print them into hard one and take them with you, and you can study them anywhere and anyplace. In addition, ADA-C01 Exam Materials offer you free demo to have a try, so that you can have a deeper understanding of what you are going to learn. You can receive the download link and password within ten minutes for ADA-C01 exam braindumps, therefore you can start your learning immediately.

Snowflake SnowPro Advanced Administrator Sample Questions (Q36-Q41):

NEW QUESTION # 36

A company has set up a new Snowflake account. An Identity Provider (IdP) has been configured for both Single Sign-On (SSO) and SCIM provisioning.

What maintenance is required to ensure that the SCIM provisioning process continues to operate without errors?

- A. The IdP service account requires a new RSA key pair to be generated every six months.
- B. The IdP Administrator must issue a REFRESH transaction at least once every six months to synchronize all users and roles.
- C. The OAuth Bearer Tokens have a lifespan of six months and must be regenerated prior to expiration.
- D. The Administrator must issue a POST RENEW call to the REST API at least once every six months.

Answer: C

Explanation:

According to the Snowflake documentation¹, the authentication process for SCIM provisioning uses an OAuth Bearer token and this token is valid for six months. Customers must keep track of their authentication token and can generate a new token on demand. If the token expires, the SCIM provisioning process will fail. Therefore, the token must be regenerated before it expires. The other options are not required for SCIM provisioning.

NEW QUESTION # 37

A virtual warehouse report_wh is configured with AUTO_RESUME=TRUE and AUTO_SUSPEND=300. A user has been granted the role accountant.

An application with the accountant role should use this warehouse to run financial reports, and should keep track of compute credits used by the warehouse.

What minimal privileges on the warehouse should be granted to the role to meet the requirements for the application? (Select TWO).

- A. USAGE
- B. MODIFY
- C. OPERATE
- D. OWNERSHIP
- E. MONITOR

Answer: A,E

Explanation:

Explanation

According to the Snowflake documentation¹, the MONITOR privilege on a warehouse grants the ability to view the warehouse usage and performance metrics, such as the number of credits consumed, the average and maximum run time, and the number of queries executed. The USAGE privilege on a warehouse grants the ability to use the warehouse to execute queries and load data. Therefore, the minimal privileges on the warehouse that should be granted to the role to meet the requirements for the application are MONITOR and USAGE. Option A is incorrect because the OPERATE privilege on a warehouse grants the ability to start, stop, resume, and suspend the warehouse, which is not required for the application. Option B is incorrect because the MODIFY privilege on a warehouse grants the ability to alter the warehouse properties, such as the size, auto-suspend, and auto-resume settings, which is not required for the application. Option E is incorrect because the OWNERSHIP privilege on a warehouse grants the ability to drop the warehouse, grant or revoke privileges on the warehouse, and transfer the ownership to another role, which is not required for the application.

NEW QUESTION # 38

What are characteristics of Dynamic Data Masking? (Select TWO).

- A. A masking policy can be applied to the VALUE column of an external table.
- B. A single masking policy can be applied to columns in different tables.
- C. A single masking policy can be applied to columns with different data types.
- D. A masking policy that is currently set on a table can be dropped.
- E. The role that creates the masking policy will always see unmasked data in query results.

Answer: B,C

Explanation:

Explanation

According to the Using Dynamic Data Masking documentation, Dynamic Data Masking is a feature that allows you to alter sections of data in table and view columns at query time using a predefined masking strategy. The following are some of the characteristics of Dynamic Data Masking:

*A single masking policy can be applied to columns in different tables. This means that you can write a policy once and have it apply to thousands of columns across databases and schemas.

*A single masking policy can be applied to columns with different data types. This means that you can use the same masking strategy for columns that store different kinds of data, such as strings, numbers, dates, etc.

*A masking policy that is currently set on a table can be dropped. This means that you can remove the masking policy from the table and restore the original data visibility.

*A masking policy can be applied to the VALUE column of an external table. This means that you can mask data that is stored in an external stage and queried through an external table.

*The role that creates the masking policy will always see unmasked data in query results. This is not true, as the masking policy can also apply to the creator role depending on the execution context conditions defined in the policy. For example, if the policy specifies

that only users with a certain custom entitlement can see the unmasked data, then the creator role will also need to have that entitlement to see the unmasked data.

NEW QUESTION # 39

A large international company with many operating regions requires data to be shared bi-directionally among all offices (head office to regional offices and regional offices among themselves). This company is a Snowflake account holder with European operations deployed in Microsoft Azure (single region) while North American regional offices are using AWS (single region) as their deployment cloud. This setup is required to comply with Personal Identifiable Information (PII) regulations in some of the European countries. The corporate head office is in Europe.

How can this data be shared bi-directionally, while MINIMIZING costs?

- A. Use bi-directional data sharing among offices in the same region and replication among offices across the continents.
- B. Use the PUT command to move files to an Amazon S3 bucket and Azure Blobs, and use an external file management application to move files within the corporate VPC.
- C. Move all the Snowflake accounts to a single region, and implement data sharing.
- D. Use data replication everywhere to reduce costs associated with same-region sharing.

Answer: A

Explanation:

According to the Snowflake documentation¹, data sharing is a feature that allows sharing selected objects in a database in one account with other accounts in the same organization, without copying or transferring any data. Data sharing is supported across regions and across cloud platforms, but it requires enabling account database replication for both the source and target accounts². Data replication is a feature that allows replicating objects from a source account to one or more target accounts in the same organization, providing read-only access for the replicated objects. Data replication is also supported across regions and across cloud platforms, but it incurs additional storage costs for the replicated data². Therefore, the best way to share data bi-directionally among all offices, while minimizing costs, is to use data sharing among offices in the same region, which does not require replication or additional storage, and use replication among offices across the continents, which provides near real-time access to the shared data. Option A is incorrect because using data replication everywhere would increase the costs associated with additional storage and compute resources for the replicated data. Option B is incorrect because using the PUT command to move files to an Amazon S3 bucket and Azure Blobs, and using an external file management application to move files within the corporate VPC, would not leverage the benefits of Snowflake's data sharing and replication features, and would also incur additional costs and complexity for data transfer and synchronization. Option C is incorrect because moving all the Snowflake accounts to a single region would violate the PII regulations in some of the European countries, and would also incur additional costs and complexity for data migration and consolidation.

NEW QUESTION # 40

What are benefits of creating and maintaining resource monitors in Snowflake? (Select THREE).

- A. The cost of running a resource monitor is only 10% of a credit, per day of operation.
- B. Multiple triggers can be configured across various virtual warehouse thresholds.
- C. Multiple resource monitors can be applied to a single virtual warehouse.
- D. Resource monitors add no additional load to virtual warehouse compute.
- E. Resource monitor governance is tightly controlled and monitors can only be created by the ACCOUNTADMIN role or users with the CREATE MONITOR privilege.
- F. Resource monitors can be applied to more than one virtual warehouse.

Answer: B,D,F

Explanation:

According to the Snowflake documentation¹, resource monitors are a feature that helps you manage and control Snowflake costs by monitoring and setting limits on your compute resources. Resource monitors do not consume any credits or add any load to the virtual warehouses they monitor¹. Resource monitors can also have multiple triggers that specify different actions (such as suspending or notifying) when certain percentages of the credit quota are reached². Resource monitors can be applied to either the entire account or a specific set of individual warehouses¹. The other options are not benefits of resource monitors. The cost of running a resource monitor is negligible, not 10% of a credit³. Multiple resource monitors cannot be applied to a single virtual warehouse; only one resource monitor can be assigned to a warehouse at a time². Resource monitor governance is not tightly controlled; account administrators can enable users with other roles to view and modify resource monitors using SQL².
