## New 305-300 Dumps | 305-300 Valid Test Materials

With all types of 305-300 test guide selling in the market, lots of people might be confused about which one to choose. Many people can't tell what kind of 305-300 study dumps and software are the most suitable for them. Our company can guarantee that our 305-300 actual questions are the most reliable. Having gone through about 10 years' development, we still pay effort to develop high quality 305-300 study dumps and be patient with all of our customers, therefore you can trust us completely. In addition, you may wonder if our 305-300 Study Dumps become outdated. We here tell you that there is no need to worry about. Our 305-300 actual questions are updated in a high speed. Since the date you pay successfully, you will enjoy the 305-300 test guide freely for one year, which can save your time and money. We will send you the latest 305-300 study dumps through your email, so please check your email then.

## Lpi LPIC-3 Exam 305: Virtualization and Containerization Sample Questions (Q61-Q66):

### NEW QUESTION # 61

Which of the following values are valid in the firmware attribute of a <os> element in a libvirt domain definition? (Choose two.)

- A. bios
- B. efi
- C. scsi
- D. virtio
- E. pcie

**Answer: A,B**

### NEW QUESTION # 62

What is the typical format for cloud-init configuration files?

- A. **.yaml**
- B. .json
- C. .xml
- D. .ini

**Answer: A**

Explanation:

Cloud-init configuration files are typically written inYAML (Yet Another Markup Language)format.

Official cloud-init documentation specifies thatcloud-configfiles use YAML syntax, which is human-readable and well suited for declarative configuration.

YAML files allow administrators to define users, packages, services, networking, and commands in a structured and consistent way.

While cloud-init can process shell scripts and MIME multipart data, YAML remains thestandard and recommended format.

Thus, the correct answer isD.

### NEW QUESTION # 63

Which of the following values would be valid in the FROM statement in aDockerfile?

- A. docker://ubuntu: focal
- B. file:/tmp/ubuntu/Dockerfile
- C. registry:ubuntu:focal
- D. http://docker.example.com/images/ubuntu-focal.iso
- E. **ubuntu:focal**

**Answer: E**

Explanation:

Explanation

The FROM statement in a Dockerfile specifies the base image from which the subsequent instructions are executed1. The value of the FROM statement can be either an image name, an image name with a tag, or an image ID1. The image name can be either a repository name or a repository name with a registry prefix2. For example, ubuntu is a repository name, and docker.io/ubuntu is a repository name with a registry prefix2. The tag is an optional identifier that can be used to specify a particular version or variant of an image1. For example, ubuntu:focal refers to the image with the focal tag in the ubuntu repository2. The image ID is a unique identifier that is automatically generated when an image is built or pulled1. For example,

sha256:9b0dafaadb1cd1d14e4db51bd0f4c0d56b6b551b2982b2b7c637ca143ad605d2 is an image ID3.

Therefore, the only valid value in the FROM statement among the given options is ubuntu:focal, which is an image name with a tag.

The other options are invalid because:

\* docker://ubuntu:focal is not a valid image name format. The docker:// prefix is used to specify a transport protocol, not a registry prefix4.

\* registry:ubuntu:focal is not a valid image name format. The registry prefix should be a valid hostname or IP address, not a generic term2.

\* file:/tmp/ubuntu/Dockerfile is not a valid image name format. The file: prefix is used to specify a local file path, not an image name5.

\* http://docker.example.com/images/ubuntu-focal.iso

is not a valid image name format.

The

http:// prefix is used to specify a web URL, not an image name

5.

### NEW QUESTION # 64

What is a container image?

- A. An operating system kernel
- B. A lightweight virtual machine
- **C. A snapshot of an application and its dependencies**
- D. A physical server

**Answer: C**

Explanation:

A container image is a static, immutable package that contains an application along with all its required dependencies, libraries, and configuration files. Containerization documentation defines a container image as a snapshot of an application and its runtime environment, which can be instantiated as a running container.

Container images do not include a full operating system kernel; instead, containers share the host system's kernel. This design makes containers lightweight and fast to deploy compared to traditional virtual machines.

Therefore, the correct answer is C.

### NEW QUESTION # 65

What is the purpose of the command `vagrant init`?

- A. It executes a provisioning tool in a running box.
- **B. It creates a Vagrant configuration file.**
- C. It starts a Vagrant box.
- D. It installs Vagrant on a Linux host.
- E. It downloads a Vagrant box.

**Answer: B**

Explanation:

The command `vagrant init` is used to initialize the current directory to be a Vagrant environment by creating an initial Vagrantfile if one does not already exist<sup>1</sup>. The Vagrantfile contains the configuration settings for the Vagrant box, such as the box name, box URL, network settings, synced folders, provisioners, etc. The command `vagrant init` does not execute any provisioning tool, start any box, install Vagrant on a Linux host, or download any box. Those actions are performed by other Vagrant commands, such as `vagrant provision`, `vagrant up`, `vagrant install`, and `vagrant box add`, respectively. References:
