## Important Tips to Pass Palo Alto Networks Cybersecurity-Practitioner Exam Quickly

Our Cybersecurity-Practitioner test prep is of high quality. The passing rate and the hit rate are both high. The passing rate is about 98%-100%. We can guarantee that you have a very high possibility to pass the exam. The Cybersecurity-Practitioner guide torrent is compiled by the experts and approved by the professionals with rich experiences. The Cybersecurity-Practitioner prep torrent is the products of high quality compiled elaborately and gone through strict analysis and summary according to previous exam papers and the popular trend in the industry. The language of the Cybersecurity-Practitioner exam material is simple and easy to be understood.

## Palo Alto Networks Cybersecurity Practitioner Sample Questions (Q184-

## Q189):

### NEW QUESTION # 184

Which Palo Alto Networks product provides playbooks with 300+ multivendor integrations that help solve any security use case?

- A. Cortex XDR
- B. Prisma Cloud
- **C. Cortex XSOAR**
- D. AutoFocus

**Answer: C**

Explanation:

SOAR tools ingest aggregated alerts from detection sources (such as SIEMs, network security tools, and mailboxes) before executing automatable, process-driven playbooks to enrich and respond to these alerts.

### NEW QUESTION # 185

Which protocol is used by both internet service providers (ISPs) and network service providers (NSPs)?

- **A. Border Gateway Protocol (BGP)**
- B. Open Shortest Path First (OSPF)
- C. Split horizon
- D. Routing Information Protocol (RIP)

**Answer: A**

Explanation:

Border Gateway Protocol (BGP) is a protocol that enables ISPs and NSPs to exchange routing information among themselves. BGP is used to determine the best path for sending data packets across the Internet. BGP is also known as the protocol of the Internet backbone, as it connects different autonomous systems (ASes) that form the Internet. BGP is not used by end systems or local networks, but only by routers that operate at the border of ASes. BGP is a complex and dynamic protocol that can handle changes in network topology, traffic load, and policy requirements. BGP is also a scalable protocol that can support the growth of the Internet<sup>1234</sup> Reference:

### NEW QUESTION # 186

What are the two most prominent characteristics of the malware type rootkit? (Choose two.)

- A. It encrypts user data.
- B. It steals personal information.
- **C. It cannot be detected by antivirus because of its masking techniques.**
- **D. It takes control of the operating system.**

**Answer: C,D**

Explanation:

A rootkit is a type of malware that enables cyber criminals to gain access to and infiltrate data from machines without being detected. It covers software toolboxes designed to infect computers, give the attacker remote control, and remain hidden for a long period of time<sup>1</sup> One of the most prominent characteristics of a rootkit is that it cannot be detected by antivirus because of its masking techniques. A rootkit may be able to subvert the software that is intended to find it, such as by hooking system calls, modifying kernel objects, or tampering with the registry<sup>2</sup> Another prominent characteristic of a rootkit is that it takes control of the operating system. A rootkit may install itself in the kernel or the firmware of the device, giving it the highest level of privilege and access. A rootkit may also replace the bootloader or the BIOS of the machine, making it difficult to remove. A rootkit can use its control over the operating system to launch other malware, such as ransomware, bots, keyloggers, or trojans<sup>34</sup> Reference:

2: Rootkit - Wikipedia

3: What Is a Rootkit? - Microsoft 365

4: What is Rootkit? Attack Definition & Examples - CrowdStrike

### NEW QUESTION # 187

Which component of cloud security uses automated testing with static application security testing (SAST) to identify potential threats?

- A. Virtualization
- B. IRP
- C. Code security
- D. API

**Answer: C**

Explanation:

Code security in cloud environments involves using tools like Static Application Security Testing (SAST) to automatically analyze source code for vulnerabilities before deployment. This helps identify and remediate potential threats early in the software development lifecycle.

### NEW QUESTION # 188

A doctor receives an email about her upcoming holiday in France. When she clicks the URL website link in the email, the connection is blocked by her office firewall because it's a known malware website. Which type of attack includes a link to a malware website in an email?

- A. phishing
- B. pharming
- C. spam
- D. whaling

**Answer: A**

Explanation:

Phishing is a type of attack that involves sending fraudulent emails that appear to be from legitimate sources, such as banks, companies, or individuals, in order to trick recipients into clicking on malicious links, opening malicious attachments, or providing sensitive information<sup>12</sup>. The link to a malware website in the email is an example of a malicious link, which may lead to the installation of malware, ransomware, spyware, or other malicious software on the user's device, or the redirection to a fake website that mimics a legitimate one, where the user may be asked to enter their credentials, personal information, or financial details<sup>34</sup>. Phishing emails often use social engineering techniques, such as creating a sense of urgency, curiosity, or fear, to persuade the user to click on the link or attachment, or to reply to the email<sup>5</sup>. Phishing emails may also spoof the sender's address, domain, or logo, to make them look more authentic and trustworthy<sup>6</sup>.

Whaling, pharming, and spam are not the correct answers for this question. Whaling is a specific type of phishing that targets high-profile individuals, such as executives, celebrities, or politicians, with the aim of stealing their confidential information or influencing their decisions<sup>7</sup>. Pharming is a type of attack that involves redirecting the user's web browser to a fake website, even if they enter the correct URL, by modifying the DNS server or the user's hosts file. Spam is the unsolicited or unwanted electronic messages, such as emails, texts, or instant messages, that are sent in bulk to a large number of recipients, usually for advertising, marketing, or scamming purposes.
