NEW QUESTION # 31

Which research design controls for the effect of taking a pretest on the outcome of an experiment?

- A. factorial design
- B. analysis of variance (ANOVA)
- C. Solomon four-group design

Answer: C

Explanation:

The Solomon four-group design is a true experimental design that specifically controls for the effects of taking a pretest. It involves four groups: two that receive a pretest and two that do not. This setup allows researchers to determine if the pretest itself has an effect on the outcomes, increasing internal validity. "The Solomon four-group design is the only experimental design that controls for both the effects of pretesting and treatment." Reference: Helwig, A. A. (2020). - A. breach of confidentiality.
- B. invasion of privacy.
- C. misappropriation.

Answer: B

Explanation:

When an assessment or test gathers psychological information about an individual without their knowledge or informed consent, it raises the ethical issue of invasion of privacy. - A. The development of career maturity
- B. The role of genetic endowment and special abilities

- C. The influence of learning experiences and environmental conditions on career decisions

- B. clients ask counselors to treat them as others have in the past.
- C. counselors become focused on their own personal issues.

Answer: A
