

Hot Real CTFL_Syll_4.0 Question | Easy To Study and Pass Exam at first attempt & Free Download

CTFL_Syll_4.0: ISTQB Certified Tester Foundation Level (CTFL) v4.0

What's more, part of that DumpsTests CTFL_Syll_4.0 dumps now are free: <https://drive.google.com/open?id=1hQZHx9cLFpoYrLSODU795VsZGL5cmqjJ>

DumpsTests's product is prepared for people who participate in the ISQI certification CTFL_Syll_4.0 exam. DumpsTests's training materials include not only ISQI certification CTFL_Syll_4.0 exam training materials which can consolidate your expertise, but also high degree of accuracy of practice questions and answers about ISQI Certification CTFL_Syll_4.0 Exam. DumpsTests can guarantee you pass the ISQI certification CTFL_Syll_4.0 exam with high score the even if you are the first time to participate in this exam.

The pass rate of CTFL_Syll_4.0 study materials are 98.95%, if you buy CTFL_Syll_4.0 study material from us, we can ensure you pass the exam successfully. Besides you can get CTFL_Syll_4.0 exam dumps in ten minutes after your payment. You can use the CTFL_Syll_4.0 exam dumps freely, if you have any questions in the process of your learning, you can consult the service stuff, and they have the professional knowledge about CTFL_Syll_4.0 Learning Materials, so don't hesitate to ask for help from them.

Valid ISQI Real CTFL_Syll_4.0 Question Are Leading Materials & Free Download Study Materials CTFL_Syll_4.0 Review

It is universally accepted that the exam is a tough nut to crack for the majority of candidates, but the related CTFL_Syll_4.0 certification is of great significance for workers in this field so that many workers have to meet the challenge. Fortunately, you need not to worry about this sort of question any more, since you can find the best solution in this website--our CTFL_Syll_4.0 Training Materials. With our continued investment in technology, people and facilities, the future of our company has never looked so bright. with our excellent CTFL_Syll_4.0 exam questions, you will pass the CTFL_Syll_4.0 exam successfully.

ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q184-Q189):

NEW QUESTION # 184

Which ONE of the following options corresponds to an activity in the testing process in which testable features are identified?

- A. Test analysis
- B. Test design
- C. Test execution
- D. Test implementation

Answer: A

Explanation:

Test analysis involves identifying the features to be tested and deriving test conditions. It is the phase where testers analyze the test basis (e.g., requirements, specifications) to identify testable aspects of the system. Test design (A) focuses on creating test cases, test implementation (C) involves preparing the test environment, and test execution (D) runs the tests.

Reference: ISTQB CTFL v4.0 Syllabus, Section 1.4.1 - Test Analysis

NEW QUESTION # 185

Consider the following user story about the authentication functionality of an e-commerce website:

"As a logged-in user, I want to change my current password with a new one, so that I can make my account safer".

The following are some of the acceptance criteria defined for the user story:

- [a] After the logged-in user has successfully changed his password, an email confirming the change must be sent to him
 - [b] To successfully change the password, the logged-in user must enter the current password, enter a new valid password, and finally confirm by pressing the 'Change Password' button
 - [c] To be valid, the new password entered by the logged-in user is not only required to meet the criteria related to the length and type of characters, but must also be different from the last 5 passwords of that user
 - [d] A dedicated error message must be presented to the logged-in user when he enters a wrong current password
 - [e] A dedicated error message must be presented to the logged-in user when he enters the correct current password, but enters an invalid password
- Based only on the given information, which of the following ATDD tests is most likely to be written first?

- A. The logged-in user enters the correct current password, enters an invalid password, and finally views the dedicated error
- B. The logged-in user submits a purchase order containing ten items, selects to pay with a Visa credit card, enters credit card information of a valid card, presses the 'Confirm' button, and finally views the dedicated message confirming that the purchase has been successful
- **C. The logged-in user enters the correct current password, enters a valid new password (different from the last 5 passwords), presses the 'Change Password' button, and finally receives the e-mail confirming that the password has been successfully changed**
- D. The logged-in user enters a wrong current password and views the dedicated error message

Answer: C

Explanation:

Explanation

ATDD stands for Acceptance Test-Driven Development, which is a collaborative approach to software development and testing, in which the acceptance criteria of a user story are defined and automated as executable tests before the implementation of the software system. ATDD tests are usually written in a Given-When-Then format, which describes the preconditions, the actions, and the expected outcomes of a test scenario. ATDD tests are intended to verify that the software system meets the expectations and the needs of the users and the stakeholders, as well as to provide feedback and guidance for the developers and the testers.

Based on the given information, the ATDD test that is most likely to be written first is the one that corresponds to option B, which is: Given the logged-in user is on the Change Password page When the user enters the correct current password, enters a valid new password (different from the last 5 passwords), and presses the Change Password button Then the user receives an email confirming that the password has been successfully changed This ATDD test is most likely to be written first, because it covers the main functionality and the happy path of the user story, as well as the most important acceptance criterion [a]. It also verifies that the user can change the password with a valid new password that meets the criteria related to the length, the type of characters, and the history of the passwords, as specified in the acceptance criterion [c]. The other options are not likely to be written first, because they either cover less critical or less frequent scenarios, such as entering a wrong current password [d] or an invalid new password [e], or they are not related to the user story or the acceptance criteria at all, such as submitting a purchase order [d]. NEW QUESTION # 186

An agile software development organization has recently hired a senior tester. The organization has distributed teams spread across time zones. They need to share test status with various stakeholders including upper management and customers at a regular interval. Which of the following statements seems to be correct with regards to the communication?

- A. Since the stakeholders include customers frequent informal communication without a specific frequency works better.
- **B. Distributed nature of teams working in various time zones means email communication will work better.**
- C. Agile nature of the project means very less documentation and hence the status need not be documented and shared in a

formal manner

- D. Since the stakeholders include upper management, formal reports delivered face-to-face are critical.

Answer: B

Explanation:

In an agile software development environment with distributed teams, effective communication is crucial.

Given the distributed nature and the time zone differences, asynchronous communication methods such as emails are more practical and effective. They ensure that information can be shared and accessed by team members and stakeholders at their convenience, regardless of time zone differences. Regular email updates also provide a documented trail of communication, which can be reviewed and referred back to as needed.

Formal face-to-face meetings can be challenging to coordinate across time zones and are not as flexible as email communications.

NEW QUESTION # 187

In which of the following test documents would you expect to find test exit criteria described?

- A. Project plan
- B. Requirements specification
- **C. Test plan**
- D. Test design specification

Answer: C

Explanation:

Test exit criteria are the conditions that must be fulfilled before concluding a particular testing phase. These criteria act as a checkpoint to assess whether we have achieved the testing objectives and are done with testing¹. Test exit criteria are typically defined in the test plan document, which is one of the outputs of the test planning phase. The test plan document describes the scope, approach, resources, and schedule of the testing activities. It also identifies the test items, the features to be tested, the testing tasks, the risks, and the test deliverables². According to the ISTQB Certified Tester Foundation Level Syllabus v4.0, the test plan document should include the following information related to the test exit criteria³:

* The criteria for evaluating test completion, such as the percentage of test cases executed, the percentage of test coverage achieved, the number and severity of defects found and fixed, the quality and reliability of the software product, and the stakeholder satisfaction.

* The criteria for evaluating test process improvement, such as the adherence to the test strategy, the efficiency and effectiveness of the testing activities, the lessons learned and best practices identified, and the recommendations for future improvements.

Therefore, the test plan document is the most appropriate test document to find the test exit criteria described.

The other options, such as test design specification, project plan, and requirements specification, are not directly related to the test exit criteria. The test design specification describes the test cases and test procedures for a specific test level or test type³. The project plan describes the overall objectives, scope, assumptions, risks, and deliverables of the software project⁴. The requirements specification describes the functional and non-functional requirements of the software product⁵. None of these documents specify the conditions for ending the testing process or evaluating the testing outcomes. NEW QUESTION # 188

An alphanumeric password must be between 4 and 7 characters long and must contain at least one numeric character, one capital (uppercase) letter and one lowercase letter of the alphabet.

Which one of the following sets of test cases represents the correct outcome of a two-value boundary value analysis applied to the password length? (Note: test cases are separated by a semicolon)

- A. aB11;99rSp;5NnN10;7iDD0a1x
- B. 1xB; aB11; 99rSp; 5NnN10; 4NnN10T; 44ghWn19
- **C. 1RhT;rSp53;3N3e10;8sBdby**
- D. 1xA;aB11;Pq1ZZab;7iDD0a1x

Answer: C

Explanation:

Explanation

The correct outcome of a two-value boundary value analysis applied to the password length is the set of test cases represented by option D. Boundary value analysis is a test design technique that focuses on the values at the boundaries of an equivalence partition, such as the minimum and maximum values, or the values just above and below the boundaries. A two-value boundary value analysis uses two values for each boundary, one representing the valid value and one representing the invalid value. For example, if the valid range of values is from 4 to 7, then the two values for the lower boundary are 3 and 4, and the two values for the upper boundary are 7 and 8. The test cases in option D use these values for the password length, while also satisfying the other requirements of the password, such as containing at least one numeric character, one capital letter, and one lowercase letter. The test cases in option D are:

1RhT: a 4-character password that is valid

rSp53: a 5-character password that is valid

3N3e10: a 6-character password that is valid

8sBdbY: an 8-character password that is invalid The test cases in the other options are incorrect, because they either use values that are not at the boundaries of the password length, or they do not meet the other requirements of the password. For example, the test cases in option A are:

1xA: a 3-character password that is invalid, but it does not contain a capital letter aB11: a 4-character password that is valid

Pq1ZZab: a 7-character password that is valid

7iDD0a1x: an 8-character password that is invalid References: ISTQB Certified Tester Foundation Level (CTFL) v4.0 sources and documents:
