Pass-Sure D-PWF-OE-00 - New Dell PowerFlex Operate Exam Study Materials

If you prefer to practice D-PWF-OE-00 exam dumps on paper, then our exam dumps is your best choice. D-PWF-OE-00 PDF version is printable, and you can print them into hard one if you like, and you can also take some notes on them and practice them anytime and anyplace. Moreover, D-PWF-OE-00 training materials cover most of knowledge points for the exam, and you can have a good command of the major knowledge points as well as improve your professional ability in the process of practicing. We offer you free update for 365 days for D-PWF-OE-00 Exam Materials after purchasing. Our system will send the update version to you automatically.

DumpsValid regularly updates Dell PowerFlex Operate Exam (D-PWF-OE-00) practice exam material to ensure that it keeps in line with the test. In the same way, DumpsValid provides a free demo before you purchase so that you may know the quality of the Dell PowerFlex Operate Exam (D-PWF-OE-00) dumps. Similarly, the DumpsValid Dell PowerFlex Operate Exam (D-PWF-OE-00) practice test creates an actual exam scenario on each and every step so that you may be well prepared before your actual Dell PowerFlex Operate Exam (D-PWF-OE-00) examination time. Hence, it saves you time and money.

We have three versions packages of the D-PWF-OE-00 exam questions to help you comprehensively. Also, all contents are carefully prepared by our researchers. So you needn't to read and memorize the boring reference books of the D-PWF-OE-00 Exam. Most people have successfully passed the exam under the assistance of our study materials. So try to trust us. Our D-PWF-OE-00 study materials will help you generate a wonderful life.

EMC Dell PowerFlex Operate Exam Sample Questions (Q55-Q60):

NEW QUESTION # 55
Which component is upgraded first during a PowerFlex cluster upgrade?

- A. Metadata Managers
- B. Fault Sets

- C. Storage Data Servers
- D. Cluster Nodes

Answer: A

Explanation:
The order of operations for a PowerFlex upgrade is strict and dictated by the software architecture.
* Metadata Managers (MDM): The MDM is the "brain" of the cluster. It holds the cluster map and configuration. It must be upgraded first (Primary, then Secondary, then Tie-Breakers) so that it can understand the newer protocol versions and manage the upgrade of the subsequent components. An older MDM cannot manage a newer SDS.
* Storage Data Servers (SDS): Once the MDMs are upgraded, the storage nodes are upgraded one by one (or fault set by fault set).
* Storage Data Clients (SDC): Finally, the host-side drivers are updated.
Therefore, A (Metadata Managers) is the correct first step. Fault Sets (C) are logical groups, not software components to be upgraded.

NEW QUESTION # 56
An administrator is preparing to upgrade a PowerFlex cluster. What steps should they follow to ensure success? (Choose two).

- A. Validate hardware compatibility for all nodes
- B. Enable deduplication for all volumes
- C. Backup the current cluster configuration
- D. Verify the cluster health status in PowerFlex Manager

Answer: C,D

Explanation:
A successful upgrade relies on a stable starting state and a recovery plan.
* Verify the cluster health status (Option D): This is the most critical pre-requisite. You must check the PowerFlex Manager dashboard or use the CLI (scli --query_cluster) to ensure the system state is
"Optimal." You cannot proceed with an upgrade if the system is in a "Degraded" state or if a Rebuild
/Rebalance is currently active, as taking a node offline for upgrade could lead to data unavailability.
* Backup the current cluster configuration (Option A): In the rare event of a catastrophic failure during the upgrade (e.g., MDM database corruption), having a recent backup of the MDM configuration allows you to restore the cluster map and volume definitions.

NEW QUESTION # 57
Enabling Maintenance Mode on a node allows it to be removed from the cluster without impacting data availability. True. False.

- A. True
- B. False

Answer: A

Explanation:
* True: The specific purpose of Protected Maintenance Mode (PMM) is to ensure data availability.
* How it works: When you enable PMM on a node, the system checks the data chunks residing on that node. Before the node is allowed to effectively "leave" the cluster (stop serving I/O), PowerFlex copies (mirrors) that data to other nodes in the cluster. This ensures that even when the node is physically removed or rebooted, the cluster retains the required number of data copies (redundancy), ensuring no data is unavailable (DU) or lost (DL).

NEW QUESTION # 58
What is the benefit of enabling deduplication in PowerFlex storage?

- A. Increases node discovery rates
- B. Reduces data redundancy and capacity footprint
- C. Ensures fault tolerance
- D. Enhances data replication speed

Answer: B

Explanation:
Deduplication (often paired with compression) is an efficiency feature available in PowerFlex Fine Granularity (FG) storage pools.
* Reduces data redundancy (Option A): The primary purpose of inline deduplication is to identify repeated data patterns (blocks) as they are written to the system. Instead of writing the same 4KB block of zeroes or identical OS files multiple times, PowerFlex writes it once and creates pointers for subsequent writes. This significantly reduces the physical storage capacity required to store data, particularly in VDI (Virtual Desktop Infrastructure) or virtualized server environments where many VMs share similar OS files.
Note: Deduplication is a trade-off; it saves space but requires more CPU/RAM overhead on the Storage Data Servers (SDS).

NEW QUESTION # 59
Which feature of PowerFlex is leveraged to expand storage capacity in a cluster?

- A. Dynamic Node Addition
- B. Snapshots
- C. Fault Sets
- D. Shared File Systems

Answer: A

Explanation:
PowerFlex is a scale-out architecture.
* Dynamic Node Addition (Option B): This refers to the ability to add new x86 servers (nodes) to the cluster on the fly. When you add a node with local drives, the PowerFlex software automatically recognizes the new capacity. It then initiates a Rebalance operation, moving data chunks from existing full nodes to the new empty node until usage is uniform across the cluster. This process increases both Storage Capacity and Performance (IOPS/Bandwidth) linearly.
Incorrect Options:
* Fault Sets (A) organize nodes for availability, they do not add capacity.
* Snapshots (C) consume capacity.
* Shared File Systems (D) manage how capacity is accessed (NAS), not the expansion of the raw block layer.
