Once you enter into our official website, you will find everything you want. All the UiPath-ADAv1 test engines are listed orderly. You just need to choose what you are willing to learn. In addition, you will feel comfortable and pleasant to shopping on such a good website. All the contents of our UiPath-ADAv1 practice test are organized logically. Each small part contains a specific module. You can clearly get all the information about our UiPath-ADAv1 Study Guide. If you cannot find what you want to know, you can have a conversation with our online workers. They have been trained for a long time. Your questions will be answered accurately and quickly. We are still working hard to satisfy your demands. Please keep close attention to our UiPath-ADAv1 training material.

UiPath-ADAv1 certification is more and more important for this area, but the exam is not easy for many candidates. Our UiPath-ADAv1 practice materials make it easier to prepare exam with a variety of high quality functions. Their quality function is observably clear once you download them. We have three kinds of UiPath-ADAv1 practice materials moderately priced for your reference. All these three types of UiPath-ADAv1 practice materials win great support around the world and all popular according to their availability of goods, prices and other term you can think of. Just come and buy them!

Hot Test UiPath-ADAv1 King | Reliable UiPath-ADAv1 Valid Exam Question: UiPath Automation Developer Associate v1 Exam 100% Pass

For candidates who are going to purchasing UiPath-ADAv1 learning materials online, they may pay more attention to money safety.

If you choose us, we can provide you with a clean and safe online shopping environment. We apply the international recognition third party for the payment of UiPath-ADAv1 exam baidumps, and therefore your money and account safety can be guaranteed. Moreover, UiPath-ADAv1 Exam Dumps are high-quality, and you can pass the exam successfully. We offer you free update for 365 days after purchasing, and the update version for UiPath-ADAv1 learning materials will be sent to your email automatically.

UiPath Automation Developer Associate v1 Exam Sample Questions (Q333-Q338):

NEW QUESTION # 333

After generating a strict selector using the Indicate target on screen option within a Click activity, what should the developer utilize to view the complete list of attributes for the targeted UI element?

- A. Open in UI Explorer
- B. Debug Mode
- C. Output Panel
- D. Properties Panel

Answer: A

Explanation:

To view the complete list of attributes for the targeted UI element after generating a selector, the developer should use the "Open in UI Explorer" option. UI Explorer is a tool that provides a detailed view of the UI elements' properties and their full selectors. It allows for editing, validating, and testing selectors for better accuracy and reliability. Therefore, the correct answer is B.

NEW QUESTION # 334

What is the difference between the UiPath Studio and UiPath StudioX development profiles?

- A. UiPath Studio is meant for business users looking to automate tasks for themselves and their immediate teams, while StudioX is meant for Automation developers.
- B. UiPath Studio allows the user to split the automation into smaller workflows that can be invoked, while StudioX doesn't offer this functionality.
- C. UiPath Studio can save values into variables for later use, while StudioX doesn't offer this functionality.
- D. UiPath Studio can only build unattended automations, while StudioX can only build attended automations.

Answer: B

Explanation:

The main difference between UiPath Studio and UiPath StudioX is their target audience and functionality.

UiPath Studio is aimed at technical users and allows for complex automation development, including the ability to split automations into smaller workflows that can be invoked from within other workflows. On the other hand, StudioX is designed for non-technical business users to automate tasks without writing code, and while it does allow for simpler workflows, it does not have the same depth of functionality as Studio for modularizing workflows.

NEW QUESTION # 335

If you rename an activity that has an automatically generated output variable in a cross-platform project, how does it impact the generated variable?

- A. The generated variable loses its scope and must be redefined manually.
- B. The generated variable is deleted when the activity is renamed.
- C. The renaming of the activity does not impact the generated variable.
- D. The generated variable is automatically renamed to match the new activity name.

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation:

In UiPath cross-platform projects, renaming an activity does not affect the generated output variable.

Step-by-Step Execution Guide:

1## Create an Activity that Generates an Output Variable

* Example: "Get Text" activity retrieves a webpage title and stores it in output_GetText.

2## Rename the Activity

* Suppose we rename "Get Text" to "Retrieve Page Title" in the workflow.

3## Check the Variable Name

* The variable remains unchanged (output_GetText).

Why?

* Automatically generated variables follow a naming convention (e.g., output_ActivityName).

* Renaming the activity does not trigger an automatic renaming of the variable.

Real-World Use Case: Extracting Invoice Data

1## A "Read PDF" activity generates the variable output_ReadPDF.2## The developer renames the activity to "Extract Invoice Data".3## The variable name remains output_ReadPDF, preventing unexpected errors in workflows.

Why the other options are incorrect?

A. The generated variable is automatically renamed - UiPath does not rename variables automatically to prevent breaking existing logic.

B. The generated variable is deleted - Variables remain intact, even if the activity is renamed.

D. The generated variable loses its scope - The scope remains the same, and the variable does not require redefinition.

NEW QUESTION # 336

Which is the recommended variable type for storing password values that are composed solely of numbers?

- A. Int64
- B. String
- C. Int32
- **D. SecureString**

Answer: D

Explanation:

The recommended variable type for storing password values, even if they are composed solely of numbers, is SecureString. A SecureString is designed to provide a more secure way to handle sensitive information as it keeps the data encrypted in memory, making it less vulnerable to potential risks such as memory dumps compared to regular string types.

NEW QUESTION # 337

In the context of the REFramework, if the OrchestratorQueueName key is present in both the Settings and Assets sheets, but an asset with the corresponding name is not present in Orchestrator, what will be the behavior at run time?

- A. An empty string will be saved for the "OrchestratorQueueName" key in the config dictionary.
- B. The "OrchestratorQueueName" key is not added to the config dictionary and the flow will throw in Get Transaction Data workflow.
- **C. The flow will use the value from the Settings sheets since the asset is missing.**
- D. The flow will throw an exception in InitAllSettings workflow.

Answer: C

Explanation:

The REFramework template is a robust and scalable framework for building RPA projects¹. It uses a config file to store the settings and constants that are used throughout the project². The config file has two sheets:

Settings and Assets. The Settings sheet contains the key-value pairs that are read by the InitAllSettings workflow and stored in the config dictionary. The Assets sheet contains the names of the assets that are stored in Orchestrator and need to be retrieved by the InitAllApplications workflow. The OrchestratorQueueName key is used to specify the name of the queue that is used to store the transaction items for the process. If the OrchestratorQueueName key is present in both the Settings and Assets sheets, but an asset with the corresponding name is not present in Orchestrator, the behavior at run time will be as follows:

- * The InitAllSettings workflow will read the value of the OrchestratorQueueName key from the Settings sheet and store it in the config dictionary.
- * The InitAllApplications workflow will try to retrieve the asset with the name OrchestratorQueueName from Orchestrator using the Get Asset activity. Since the asset does not exist, the activity will throw an exception.
- * The exception will be caught by a Try Catch block and handled by a Log Message activity with level Warning and message "Asset not found: OrchestratorQueueName".
- * The flow will continue with the next asset in the Assets sheet or move to the next state if there are no more assets.
- * The flow will use the value of the OrchestratorQueueName key from the config dictionary whenever it needs to access or update the queue.

Therefore, option B is correct. Option A is incorrect because the exception is thrown in InitAllApplications workflow, not InitAllSettings workflow. Option C is incorrect because an empty string is not saved for the OrchestratorQueueName key in the config dictionary. Option D is incorrect because the OrchestratorQueueName key is added to the config dictionary and the flow does not throw in Get Transaction Data workflow.
