CompTIA SY0-701 덤프의 높은 적중율에 놀란 회원분들이 계십니다. 고객님들의 도와 CompTIA SY0-701 시험을 쉽게 패스하는게 저희의 취지이자 최선을 다해 더욱 높은 적중율을 자랑할수 있다록 노력하고 있습니다. 뿐만 아니라 Itexamdump에서는한국어 온라인서비스상담, 구매후 일년무료업데이트서비스, 불합격받을수 환불혹은 덤프교환 등탄탄한 구매후 서비스를 제공해드립니다.

CompTIA SY0-701 시험요강:

주제	소개
주제 1	• Security Program Management and Oversight: Finally, this topic discusses elements of effective security governance, the risk management process, third-party risk assessment, and management processes. Additionally, the topic focuses on security compliance requirements, types and purposes of audits and assessments, and implementing security awareness practices in various scenarios.
주제 2	• Security Architecture: Here, you'll learn about security implications across different architecture models, applying security principles to secure enterprise infrastructure in scenarios, and comparing data protection concepts and strategies. The topic also delves into the importance of resilience and recovery in security architecture.

주제 3	• Security Operations: This topic delves into applying common security techniques to computing resources, addressing security implications of proper hardware, software, and data asset management, managing vulnerabilities effectively, and explaining security alerting and monitoring concepts. It also discusses enhancing enterprise capabilities for security, implementing identity and access management, and utilizing automation and orchestration for secure operations.
주제 4	• General Security Concepts: This topic covers various types of security controls, fundamental security concepts, the importance of change management processes in security, and the significance of using suitable cryptographic solutions.
주제 5	• Threats, Vulnerabilities, and Mitigations: In this topic, you'll find discussions comparing threat actors and motivations, explaining common threat vectors and attack surfaces, and outlining different types of vulnerabilities. Moreover, the topic focuses on analyzing indicators of malicious activity in scenarios and exploring mitigation techniques used to secure enterprises against threats.

질문 # 255
Which of the following best describes why me SMS DIP authentication method is more risky to implement than the TOTP method?

- A. The SMS OTP method requires an end user to have an active mobile telephone service and SIM card.
- B. The SMS OTP is more likely to be intercepted and lead to unauthorized disclosure of the code than the TOTP method.
- C. The algorithm used to generate on SMS OTP code is weaker than the one used to generate a TOTP code
- D. Generally. SMS OTP codes are valid for up to 15 minutes while the TOTP time frame is 30 to 60 seconds

정답：B

설명：
The SMS OTP (One-Time Password) method is more vulnerable to interception compared to TOTP (Time- based One-Time Password) because SMS messages can be intercepted through various attack vectors like SIM swapping or SMS phishing. TOTP, on the other hand, generates codes directly on the device and does not rely on a communication channel like SMS, making it less susceptible to interception.

질문 # 256
Which of the following should a systems administrator use to ensure an easy deployment of resources within the cloud provider?

- A. Infrastructure as code
- B. Software as a service
- C. Software-defined networking
- D. Internet of Things

정답：A

설명：
Infrastructure as code (IaC) is a method of using code and automation to manage and provision cloud resources, such as servers,

networks, storage, and applications. IaC allows for easy deployment, scalability, consistency, and repeatability of cloud environments. IaC is also a key component of DevSecOps, which integrates security into the development and operations processes.

질문 # 257

After a company was compromised, customers initiated a lawsuit. The company's attorneys have requested that the security team initiate a legal hold in response to the lawsuit. Which of the following describes the action the security team will most likely be required to take?

- A. Retain all emails from the company to affected customers for an indefinite period of time.
- B. Retain any communications between security members during the breach response.
- C. Retain the emails between the security team and affected customers for 30 days.
- D. Retain any communications related to the security breach until further notice.

정답：D

설명：

A legal hold (also known as a litigation hold) is a notification sent from an organization's legal team to employees instructing them not to delete electronically stored information (ESI) or discard paper documents that may be relevant to a new or imminent legal case. A legal hold is intended to preserve evidence and prevent spoliation, which is the intentional or negligent destruction of evidence that could harm a party's case. A legal hold can be triggered by various events, such as a lawsuit, a regulatory investigation, or a subpoena.

In this scenario, the company's attorneys have requested that the security team initiate a legal hold in response to the lawsuit filed by the customers after the company was compromised. This means that the security team will most likely be required to retain any communications related to the security breach until further notice. This could include emails, instant messages, reports, logs, memos, or any other documents that could be relevant to the lawsuit. The security team should also inform the relevant custodians (the employees who have access to or control over the ESI) of their preservation obligations and monitor their compliance. The security team should also document the legal hold process and its scope, as well as take steps to protect the ESI from alteration, deletion, or loss.

질문 # 258

A vendor needs to remotely and securely transfer files from one server to another using the command line.
Which of the following protocols should be Implemented to allow for this type of access? (Select two).

- A. SMTP
- B. SNMP
- C. SFTP
- D. S/MIME
- E. SSH
- F. RDP

정답：C,E

설명：

Secure Shell (SSH) is a protocol used for secure command-line access to remote systems, while Secure File Transfer Protocol (SFTP) is an extension of SSH used specifically for securely transferring files. Both SSH and SFTP ensure that data is encrypted during transmission, protecting it from interception or tampering.

질문 # 259

A business uses Wi-Fi with content filleting enabled. An employee noticed a coworker accessed a blocked sue from a work computer and repotted the issue. While Investigating the issue, a security administrator found another device providing internet access to certain employees. Which of the following best describes the security risk?

- A. A rogue access point Is allowing users to bypass controls.

- B. A valid access point is being jammed to limit availability.
- C. The host-based security agent Is not running on all computers.
- D. Employees who have certain credentials are using a hidden SSID.

정답：A

설명：

The presence of another device providing internet access that bypasses the content filtering system indicates the existence of a rogue access point. Rogue access points are unauthorized devices that can create a backdoor into the network, allowing users to bypass security controls like content filtering. This presents a significant security risk as it can expose the network to unauthorized access and potential data breaches.
