The best investment for the future is improving your professional ability and obtaining dbt-Analytics-Engineering certification exam will bring you great benefits for you. For most IT candidates, passing dbt-Analytics-Engineering actual test will make you stand out from the other people in the interview and offer you more opportunity. The matter now is how to prepare the dbt-Analytics-Engineering Questions and answers in a short time, our dbt-Analytics-Engineering study guide is the best effective way to get through

the exam and obtain the certification.

dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q181-Q186):

NEW QUESTION # 181

28. Consider this DAG:

* model_a # model_c # model_e

* model_b # model_d # model_f

(With model_c and model_d both feeding into the final layer.)

You execute:

```
dbt run --fail-fast
```

in production with 2 threads. During the run, model_b and model_c are running in parallel when model_b returns an error.

Assume there are no other errors in the model files, and model_c was still running when model_b failed.

Which model or models will successfully build as part of this dbt run? Choose 1 option.

- A. model_a
- B. model_a, model_c, model_d, model_e, model_f
- C. model_a, model_c
- D. model_a, model_c, model_e

Answer: C

Explanation:

The --fail-fast flag tells dbt to stop scheduling any new nodes as soon as one node fails. Importantly, dbt does not kill models that are already running; in-flight nodes are allowed to finish.

Here's what happens step by step with 2 threads:

* Roots model_a and model_b start first.

* model_a finishes successfully. That makes model_c eligible to run.

* dbt now runs model_b and model_c in parallel.

* While they are running, model_b fails.

* Because --fail-fast is set, dbt immediately stops scheduling any additional models (like model_d, model_e, or model_f).

* model_c was already running when model_b failed, so it is allowed to complete successfully.

Downstream models of either branch (model_d, model_e, and model_f) never start, because fail-fast prevents any further nodes from being queued after the first failure.

So, the only models that successfully build during this run are:

* model_a (completed before model_b failed)

* model_c (already running at the time of failure and allowed to finish) Hence the correct choice is B: model_a, model_c.

NEW QUESTION # 182

You discover that dbt models run significantly slower in your production environment than in development. What potential causes should you investigate?

- A. Network latency impacting access to remote data sources.
- B. Different database configurations or resource allocations (memory, CPU, etc.) between environments-
- C. Inefficient use of snapshots or incremental models in your production dbt project_
- D. Production data volume being significantly larger than development data.

Answer: A,B,D

Explanation:

Each of these directly affects performance and could differ significantly between environments. C is relevant, but less likely the sole cause if development is performant.

NEW QUESTION # 183

A package you depend on has released a major update with breaking changes. How might you approach the migration?

- A. Update your packages.yml to point to the new version and immediately refactor all your dependent models.

- B. Review the release notes and the migration guide provided by the package maintainers.
- C. Pin the package to the older version in your packages.yml file and plan a controlled migration.
- D. Fork the package and maintain your own custom version indefinitely.

Answer: B

Explanation:

Understanding the changes is key' Then plan a staged migration to minimize disruption. Forking should be a last resort.

NEW QUESTION # 184

After merging a large pull request, you notice a critical issue introduced in one of the commits. What actions might be necessary?

- A. Use git cherry-pick to apply specific commits from the reverted change to another branch, effectively restoring the necessary parts.
- B. Use git revert to create a new commit that specifically undoes the problematic changes.
- C. Identify the problematic commit using git log or git blame.
- D. All of the above could be needed as part of the fix.

Answer: D

Explanation:

A: git revert provides a way to 'undo' changes safely. B: Identifying the source of the issue is essential. C: git cherry-pick lets you selectively reintroduce only the necessary portions in a controlled manner.

NEW QUESTION # 185

When integrating a new data source, you notice many existing models could benefit from it. What's the most maintainable way to incorporate the new data within a DRY approach?

- A. Build a snapshot of the new data combined with relevant data from existing models.
- B. Establish a naming convention for the new data elements to avoid hardcoding them within model SQL.
- C. Create a base model that incorporates the new data source and use the ref() function in downstream models.
- D. Add the new data source directly to each relevant model's SQL query.

Answer: C

Explanation:

A base model serves as a modular point of integration for the new data. The ref() function promotes DRY principles and eases maintenance if the new source structure changes.
