## **Analytics-DA-201 Real Testing Environment & Reliable Analytics-DA-201 Exam Review**

If you are a person who desire to move ahead in the career with informed choice, then the Salesforce training material is quite beneficial for you. The Analytics-DA-201 pdf vce is designed to boost your personal ability in your industry. It just needs to spend 20-30 hours on the Analytics-DA-201 Preparation, which can allow you to face with Analytics-DA-201 actual test with confidence. You will always get the latest and updated information about Analytics-DA-201 training pdf for study due to our one year free update policy after your purchase.

## **Salesforce Certified Tableau Data Analyst Sample Questions (Q106-Q111):**

### **NEW QUESTION # 106**

You have two tables named EmployeeInfo and DepartmentInfo. EmployeeInfo contains four fields named Full Name, Department ID, Start Date, and Salary.

DepartmentInfo contains four fields named Department Name, Size, Department ID, and VP.

You want to combine the tables to meet the following requirements:

- . Each record in EmployeeInfo must be retained in the combined table.
- . The records must contain the Department Name, Size, and VP fields.

\* Every record must have a full name.

Which type of join should you use?

- A. Full outer
- B. Union

- C. Inner
- D. Left

**Answer: D**

Explanation:

To combine the tables and meet the requirements, you should use a left join. A left join will keep all the records from the left table (EmployeeInfo) and match them with the records from the right table (DepartmentInfo) based on the common field (Department ID). If there is no matching record in the right table, the fields from the right table will be null. This way, you will retain all the records from EmployeeInfo, and also include the Department Name, Size, and VP fields from DepartmentInfo. Every record will have a full name because it is a field from the left table. A left join will look like this:

Join Types in Tableau

### NEW QUESTION # 107

You have the following dataset

You need to create the following visualization.

Which quick table calculation should you drag to Text on the Marks card?

- A. Percent Difference
- B. Percentile
- C. Compound Growth Rate
- D. Percent of Total

**Answer: D**

Explanation:

we need to create a quick table calculation that shows the percent of total sales for each category and sub- category. To do this, we can follow these steps:

\* Drag Category to Columns and Sub-Category to Rows.

\* Drag Sales to Text on the Marks card.

\* Right-click Sales on the Marks card and select Quick Table Calculation > Percent of Total.

\* Right-click Sales on the Marks card again and select Compute Using > Category.

This will create a quick table calculation that shows the percent of total sales for each sub-category within each category. The

visualization will look like this:

### NEW QUESTION # 108

You have the following worksheet.

**Answer:**

Explanation:

### NEW QUESTION # 109

You want to create the following table in a view.

Segment	Position	Sales
Corporate		706,146
Home Office		429,653
Consumer	-2	1,161,401

Which function should you use to create the Position column?

- A. LAST
- **B. FIRST**
- C. RANK
- D. INDKX

**Answer: B**

Explanation:

To create the Position column, you should use the FIRST () function. The FIRST () function returns the number of rows from the current row to the first row in the partition. For example, the first row in a partition will return 0, the second row will return -1, and so on. In this question, the partition is defined by the Segment field, and the table is sorted by the Sales field in descending order. Therefore, the Position column shows the offset of each row from the first row in each segment, based on the sales ranking.

### NEW QUESTION # 110

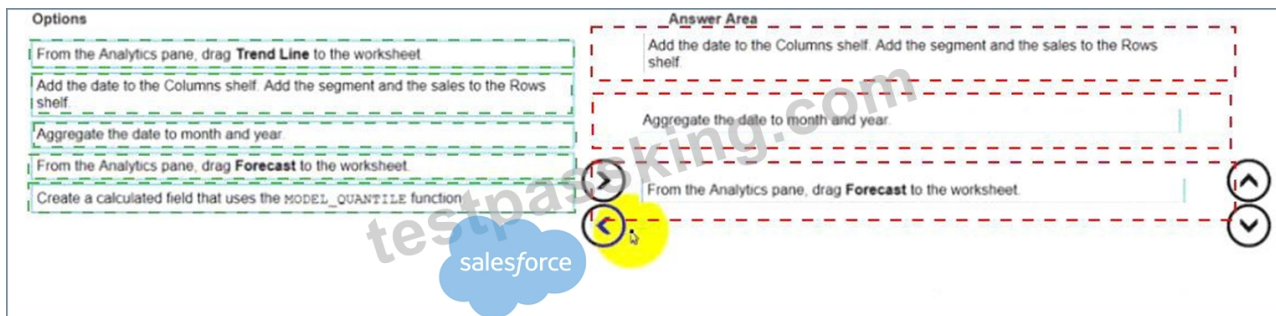

You have a dataset that contains daily sales by business segment from 2017 to the present. You want to use monthly historical trends to predict sales by segment in the future. Which three actions should you perform in order?

(Place the three correct options in order. Use the arrows to move Options to Answer Area. In Answer Area, arrows to re-order the options.)

**Answer:**

Explanation:

Explanation:

The correct order of the three actions is:

- \* Add the date to the Columns shelf. Add the segment and the sales to the Rows shelf
- \* Aggregate the date to month and year.
- \* From the Analytics pane, drag Forecast to the worksheet.

The first action is to add the date to the Columns shelf and the segment and the sales to the Rows shelf. This will create a line chart that shows the daily sales by segment over time. You can use the Show Me menu to choose a line chart if it is not selected by default.

The second action is to aggregate the date to month and year. This will group the daily sales into monthly sales and show the yearly trend. You can right-click on the date field on the Columns shelf and select Month (January 2017) from the menu. You can also drag Year from the Dimensions pane to the Columns shelf before or after Month.

The third action is to drag Forecast from the Analytics pane to the worksheet. This will add a forecast that predicts future sales by segment based on historical trends. You can customize the forecast by clicking on it and using the options on the Marks card.

The other options are not relevant for this scenario. Adding a trend line would show a linear or nonlinear relationship between two measures, but not a prediction of future values. Creating a calculated field that uses the model quantile function would return a value from a statistical model based on a given quantile, but not a forecast.
