It is evident to all that the MB-820 test torrent from our company has a high quality all the time. A lot of people who have bought our products can agree that our MB-820 test questions are very useful for them to get the certification. There have been 99 percent people used our MB-820 Exam Prep that have passed their exam and get the certification. It means that our MB-820 test questions are very useful for all people to achieve their dreams, and the high quality of our MB-820 exam prep is one insurmountable problem.

All of the traits above are available in this web-based Microsoft Dynamics 365 Business Central Developer (MB-820) practice test of DumpsFree. The main distinction is that the Microsoft Dynamics 365 Business Central Developer (MB-820) online practice test works with not only Windows but also Mac, Linux, iOS, and Android. Above all, taking the Microsoft Dynamics 365 Business Central Developer (MB-820) web-based practice test while preparing for the examination does not need any software installation.

Score High in MB-820 Exam with Microsoft's Exam Questions and Attain 100% Success

As we all, having a general review of what you have learnt is quite important, it will help you master the knowledge well. MB-820 Online test engine has testing history and performance review, and you can have a review through this version. In addition, MB-820 Online test engine supports all web browsers and Android and iOS etc. MB-820 Exam Materials of us offer you free demo to have a try before buying MB-820 training materials, so that you can have a deeper understanding of what you are going to buy. You can receive your downloading link and password within ten minutes, so that you can begin your study right away.

Microsoft Dynamics 365 Business Central Developer Sample Questions (Q50-Q55):

NEW QUESTION # 50

You are creating an entitlement object in Business Central to enable transactability for AppSource apps.

You must map the entitlement object to a plan in Partner Center.

You need to select the value of the Type property to use in the entitlement object.

Which value should you use?

- **A. PerUserServicePlan**
- B. Unlicensed
- C. Role
- D. Implicit

Answer: A

Explanation:

In Business Central, when creating an entitlement object to enable transactability for AppSource apps and mapping it to a plan in Partner Center, the Type property of the entitlement object should be set to PerUserServicePlan (A). The PerUserServicePlan type is used to define an entitlement that is based on a service plan, which is typically how transactability features are managed for apps distributed through AppSource. This type of entitlement allows for the mapping of specific features or capabilities of the app to a service plan in Partner Center, enabling granular control over what users are entitled to use based on their subscription. The other values, such as Implicit (B), Unlicensed (C), and Role (D), are used in different contexts and do not apply to the scenario of mapping an entitlement object to a plan for AppSource apps.

NEW QUESTION # 51

A developer creates a profile for part-time shop supervisors and adds customizations.

You plan to add new requirements to the profile.

You need to analyze the code to understand the profile and make sure there are no errors.

☐ For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

☐

Answer:

Explanation:

☐ Explanation:

The Part Time Shop Supervisor profile will be applied only to users with "Register Time" = true on User Setup: No Variables, procedures, and triggers cannot be added on page customization objects: Yes Line 10 should use extends instead of customizes: No In line 18, "Unit Cost" will be moved after "Costing Method": Yes The Part Time Shop Supervisor profile will be applied only to users with "Register Time" = true on User Setup.

* No

* The code doesn't contain any reference to the User Setup table or the Register Time field, so this is not correct. Profiles are not applied conditionally based on fields like this.

Variables, procedures, and triggers cannot be added on page customization objects.

* Yes

* Page customization objects are meant for UI modifications, such as moving or hiding fields. You cannot add variables, procedures, or triggers in a page customization object.

Line 10 should use extends instead of customizes.

* No

* In AL, when customizing a page within a profile, you use customizes rather than extends. Extends is used when modifying base application objects, but customizes is used to customize pages within a profile.

In line 18, "Unit Cost" will be moved after "Costing Method".

* Yes

* The code in line 18 is correct. The moveafter directive will move the "Unit Cost" field after the "Costing Method" field on the page layout.

NEW QUESTION # 52

A company is deploying Business Central on-premises.

The company plans to use a single-tenant deployment architecture.

You need to describe how the data is stored and how the Business Central Server is configured.

In which two ways should you describe the single-tenant architecture? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Multiple customers share multiple Business Central Server instances.
- B. Multiple customers share a single Business Central Server.
- C. Each customer has their own Business Central Server.
- D. The application and business data are stored in separate databases.
- E. The application and the business data are stored in the same database.

Answer: C,E

Explanation:

In a single-tenant deployment architecture of Business Central on-premises, the following characteristics describe how the data is stored and how the Business Central Server is configured:

* The application and the business data are stored in the same database (B): In a single-tenant architecture, each tenant (which typically corresponds to a single customer) has its own dedicated database. This database contains both the application objects (such as pages, reports, codeunits, etc.) and the business data (such as customer, vendor, and transaction records). This setup ensures that each tenant's data is isolated and can be managed independently.

* The application and business data are stored in separate databases (D): While (B) is a characteristic of a single-tenant deployment, it's important to clarify that in some configurations, the application objects can be stored in a separate database from the business data. This approach can be used for easier maintenance and upgrades of the application code without affecting the business data. However, each tenant still has its own set of databases, maintaining the single-tenancy model.

The other options provided do not accurately describe a single-tenant architecture:

* Each customer has their own Business Central Server (A): This statement might be misleading. In a single-tenant deployment, while each customer has their own database, they do not necessarily have their own Business Central Server instance. Multiple databases (tenants) can be hosted on a single server instance, although they are not shared across customers.

* Multiple customers share a single Business Central Server (C) and Multiple customers share multiple Business Central Server instances (E): These options describe a multi-tenant architecture rather than a single-tenant one. In a multi-tenant setup, multiple customers (tenants) can share the same server instance and even the same application database, with data isolation ensured at the application level.

Topic 2, Case Study Alpine Ski House

Alpine Ski House is a company that owns and operates hotels, restaurants, and stores. Currently, the company uses the following software and interface:

* Property management software (PMS) to manage hotel rooms

* On-premises accounting software to generate sales invoices and create purchase orders

* An API that allows restaurants and stores to obtain necessary information Restaurants and stores use standalone software for point of sale (POS) devices. Each day, the POS terminals generate a text file of sales data and save the files in a server folder. An account assistant must manually import the files to the current software tables to be processed by the system.

The general manager receives several reports monthly from department managers. The reports take too much time to prepare.

The company is moving from a different system to Business Central online to manage the whole company.

The company plans to increase efficiency in every department by using APIs to obtain or share information between the different systems.

Each department involved in purchasing must be able to make purchase requests automatically and easily.

The departments do not need access to the full ERP management system.

Alpine Ski House requires the development of several extensions for the planned improvements. Business Central design patterns must be used to develop all extensions.

Alpine Ski House must develop the following pages:

* Pages that provide multiple configurations in a multistep dialog, like a wizard, to provide required information when the extensions are first installed

* Department-specific Role Center pages to show relevant information and pages with additional information The IT department plans to use Power BI to analyze departmental information. The database must be configured to provide optimal performance.

The housekeeping department requires the following to increase efficiency and help avoid data entry errors:

* A Housekeeping Role Center to minimize navigation to relevant areas In Business Central online and to show relevant information in it

* Pages to embed into a new Room page to show additional information about the Room entity

* A table named Room Incident for the housekeeping team to enter room issue information

* A Housekeeping canvas app that connects to an extension

The department requires the development of an extension with a new API page named RoomsAPI.

- * The housekeeping team will use RoomsAPI to publish room details, update when work is complete, or provide repair notifications from the canvas app.
- * This custom API page must expose a custom table named Rooms and have an ID 50000. The table must be able to update from the PMS. The PMS team must know the end to connect to the custom API.
- * A developer provides the following details for the API page:
 - APIPublisher = 'alpine';
 - APIGroup = 'integration';
 - APIVersion = 'v2.6';
 - entityName = 'room';
 - EntitySetName = 'rooms';
- * The extension must be published in Business Central online and include a list page named Room List that includes all hotel rooms.
- * Installation or updates to this extension must meet the following requirements:
 - o Some web services must be published automatically.
 - o The version of the specified application's metadata must be obtained in AL language.
 - o The code required to perform tasks cannot be accessible from other parts of the application.
- The Room Incident table information must include the following fields:
 - * Incident entry: An incremental number
 - * Room No.: A room from the Room table
 - * Incident Date: The work date
 - o The table definition in the Room Incident table must autofill the Incident Date when the housekeeping team inserts a new record, o The value for Incident Date must be the work date configured in the Business Central online client.
 - * Status: Includes the following options to identify the status of the incident:
 - o Open: When the Room Incident is created
 - o In Progress: When someone starts repair work
 - o Closed: When the incident is solved
 - * Incident Closing Date: Auto-updating field (when the status passes to Closed, the field will update with the work date)
 - * Incident Description: Text
 - * Image. Media data type
 - o The stored picture must be downloadable from a menu action.
 - o A Room Incident page must be developed to contain the download action.
- To increase efficiency, the new system must manage the generated data from the restaurants and stores directly by using the API on the POS terminals.
 - * The company requires a code unit called from a job queue to read the information from the POS terminal APIs.
 - * The POS terminal information must be stored in a table named POS Information, have an ID 50100. and be editable on a page.
 - * The account manager requires an option on the menu of the page to run the process manually.
- To analyze the information received from the POS terminals, the company requires:
 - * A custom API named ticketAPI to export the information to Power BI
 - * Use of the Read Scale-Out feature to improve database performance
- The purchasing department requires a new entity in Business Central online to log non-conformities of goods received from vendors. The entity must be set up as follows:
 - * The non-conformity entity must have two tables:
 - o a header with common information
 - o one or more lines with the detailed received items that are non-conforming
 - * The entity requires a page named Non-conformity and a subpage named Non-Conformity Lines to store the information.
- When a purchase order with incorrect quantity or quality issues is received, the entity must create a non-conformity document in the system. The following information must be in the document:
 - * Non-conformity Number: must use the No. Series table from Business Central online to manage this field and use these features:
 - o Alphanumeric values
 - o Number format that includes "NO and the year as part of the number: for example, NC24-001
 - * Non-conformity Date: stores only the creation date
 - * Vendor No.: stores the number of the vendor that sent the items; only vendors from the company must be included
 - * Owner: code of an employee defined in the company
 - * Receipt No.: must meet the following conditions:
 - o Be an existing receipt No.
 - o Be received from the vendor indicated in the Vendor No. field
 - * Comments: can include comments with rich text and pictures to illustrate quality problems »
 - * Status: includes nonconformity statuses, such as:
 - o Open
 - o Notified
 - o Closed
 - * Lines must contain the following details:

- o Item No.: item received (for existing inventory items only)
- o Description: item description
- 0 Quantity: non-conforming quantity
- 0 Non-conformity Type:
- # Quality
- # Quantity
- # Delivery date

The serial numbers of the non-conformities and the period in which they can be created must be in a configuration table and its corresponding page to allow them to be modified for the users.

NEW QUESTION # 53

You are treating an app for Business Central.

You plan to specify the following parameters and properties of the server and app.

- * Startup object type and object ID
- * Runtime
- * Dependencies

You need to configure the JSON file for the specified parameters and properties Which JSON files should you configure? To answer, move the appropriate files to the correct object purposes You may use each file once, more than once, or not at all You may need to move the split bar between panes or scroll to view content NOTE Each correct selection is worth one point.

□

Answer:

Explanation:

□ Explanation:

□

NEW QUESTION # 54

You create the following Vendor table and Item table in Business Central.

□

You require the following data set to assign vendors to items.

□

You need to create a query to assign the vendors.

□

Which three code blocks should you use to develop the solution? To answer, move the appropriate code blocks from the list of code blocks to the answer area and arrange them in the correct order.

NOTE: More than one order of answer choices is correct. You will receive credit for any of the correct orders you select.

□

Answer:

Explanation:

□

Explanation:

To create a query that assigns vendors to items in Business Central, use the following code blocks in sequence:

* dataitem(Vendor; Vendor)

* dataitem(Item; Item)

* DataItemLink = "Vendor No." = Item.Vendor_No;

Creating a query:

In Business Central, a query object is used to combine data from multiple tables. You start by specifying each table as a data item.

In this case, you would start with the Vendor table and then the Item table. After specifying the data items, you need to link them together. The DataItemLink property is used to establish a relationship between two data items based on a common field. Here, you are linking the Vendor and Item tables on the "Vendor No." field, which is present in both tables. This link ensures that the query will return a dataset that includes related records from both tables based on the vendor number. The order of the code blocks ensures the logical flow and relationships between tables as required for the query.

NEW QUESTION # 55

.....

At the fork in the road, we always face many choices. When we choose job, job are also choosing us. Today's era is a time of fierce competition. Our MB-820 exam question can make you stand out in the competition. Why is that? The answer is that you get the certificate. What certificate? Certificates are certifying that you have passed various qualifying examinations. Watch carefully you will
