MANAGING CLOUD SECURITY – WGU C838 2023-2024 QUESTIONS AND ANSWERS WITH CORRECT ANSWERS

Broad network access - ANSWER- There should never be network bandwidth bottlenecks.

On-demand services - ANSWER- Refers to the model that allows customers to scale their compute and/or storage needs with little or no intervention from or prior communication with the provider.

Resource pooling - ANSWER- Characteristic that allows the cloud provider to meet various demands from customers while remaining financially viable.

measured/metered service - ANSWER- The customer is charged for only what they use and nothing more.

Business Impact Analysis (BIA) - ANSWER- An assessment of the priorities given to each asset and process within the organization

personally identifiable information (PII) - ANSWER- Under current laws, no cloud customer can transfer risk or liability associated with the inadvertent or malicious disclosure of <blank>.

Elasticity - ANSWER- This is the flexibility of allocating resources as needed for immediate usage, instead of purchasing resources according to other variables.

Simplicity - ANSWER- Usage and administration of cloud services ought to be transparent to cloud customers and users; from their perspective, a digital data service is paid for and can be used, with very little additional input other than what is necessary to perform their duties.

Scalability - ANSWER- The organization's computing needs won't remain static; there will be new (and hopefully more) users, customers, and data as the organization continually matures.

Infrastructure as a Service (IaaS) - ANSWER- The most basic of cloud service offerings, <blank> allows the customer to install all software, including operating systems (OSs) on hardware housed and connected by the cloud vendor.

Platform as a Service (PaaS) - ANSWER- <Blank> contains everything included in IaaS, with the addition of OSs.

WGU Managing Cloud Security (JY02) Sample Questions (Q185-Q190):

NEW QUESTION # 185

An organization consists of many divisions. Its leadership team has gathered the managers and key team members in each division to help create a disaster recovery plan. It studies the type of natural events that commonly occur and the risk involved for each location in which the organization has a data center. What is the leadership team doing in this scenario?

- A. Defining the disaster criteria
- B. Identifying the actions
- C. Performing an asset inventory
- D. Running a disaster declaration process

Answer: A

Explanation:

By analyzing natural events that could impact data centers and assessing the risks associated with each, the leadership team is defining the disaster criteria. This step determines what conditions or events qualify as disasters requiring activation of the recovery plan.

An asset inventory identifies systems, but here the focus is on external events. A disaster declaration process occurs during an actual event, and identifying actions comes later when response strategies are created.

Defining disaster criteria is essential to avoid ambiguity during crises. It establishes thresholds such as

"category 4 hurricanes," "regional power outages exceeding 12 hours," or "seismic events over a set magnitude." Clear criteria ensure consistent decision-making and timely activation of recovery procedures.

NEW QUESTION # 186

Which data retention method is used for business continuity and disaster recovery (BC/DR) backups?

- A. Monitoring and enforcement
- B. Archiving and retrieval procedures
- C. Local agent checks
- D. Data classification

Answer: B

Explanation:

Archiving and retrieval procedures are the data retention method used for business continuity and disaster recovery (BC/DR) backups. Managing Cloud principles describe BC/DR as a critical operational function that ensures data can be restored following system failures, cyber incidents, or natural disasters.

Archiving involves securely storing backup data in a manner that preserves integrity and availability over time. Retrieval procedures define how quickly and effectively data can be accessed and restored when needed.

Together, these procedures ensure that organizations can resume operations with minimal disruption.

The other options do not support BC/DR directly. Data classification categorizes data by sensitivity, local agent checks focus on endpoint health, and monitoring and enforcement apply to security oversight rather than retention. Therefore, archiving and retrieval procedures are essential for BC/DR backups.

NEW QUESTION # 187

An organization is concerned that it will be unable to recover or access data if the cloud provider goes into bankruptcy and leaves the market. How is this concern addressed in a business continuity and disaster recovery plan?

- A. Enable multiple zones to mitigate service disruptions
- B. Revise contractual and personnel obligations

- C. Consider options for portability and interoperability
- D. Use best tools to securely connect to the cloud

Answer: C

Explanation:

This concern is addressed by considering portability and interoperability options. Managing Cloud guidance explains that organizations must plan for provider exit scenarios to avoid dependency risks.

Portability ensures data and workloads can be moved to another provider or on-premises environment, while interoperability supports compatibility across platforms. This may include standardized data formats, documented APIs, and offsite backups.

Multiple zones address outages, not provider bankruptcy. Contract revisions help legally but do not guarantee recovery. Therefore, portability and interoperability are the correct focus.

NEW QUESTION # 188

Which cloud computing role can subscribe to a software as a service (SaaS) application?

- A. Cloud service customer
- B. Cloud service provider
- C. Cloud computing
- D. Cloud application

Answer: A

Explanation:

A cloud service customer is the role that subscribes to a software as a service (SaaS) application. Managing Cloud principles define the cloud service customer as the individual or organization that consumes cloud services provided by a cloud service provider.

In a SaaS model, the customer accesses applications through a subscription-based arrangement, typically via a web interface. The customer does not manage the underlying infrastructure or platform but is responsible for configuring user access and ensuring proper use of the service.

The cloud service provider delivers and manages the application, while "cloud computing" and "cloud application" are not roles. Therefore, the cloud service customer is the correct role.

NEW QUESTION # 189

Which term describes data elements that, when combined with other information, are used to single out an individual?

- A. Indirect identifiers
- B. Direct identifiers
- C. Data subjects
- D. Personal details

Answer: A

Explanation:

Indirect identifiers are pieces of information that may not identify an individual on their own but, when combined with other data, can uniquely identify someone. Examples include birthdate, ZIP code, or gender.

Together, these can re-identify a person, even when names or direct identifiers are removed.

Direct identifiers (such as Social Security numbers) uniquely identify an individual alone. Data subjects are the individuals to whom the data refers, while personal details is too broad and not a formal term.

Understanding indirect identifiers is essential in privacy regulations like GDPR and HIPAA, where pseudonymization or anonymization must account for potential re-identification risks. Safeguarding indirect identifiers reduces the chance of privacy violations and unauthorized profiling.
