## Salesforce Platform Developer I (PDI) Sample Questions (Q168-Q173):

### NEW QUESTION # 168

Universal Container is building a recruiting app with an Applicant object that stores information about an individual person that represents a job. Each application may apply for more than one job.

What should a developer implement to represent that an applicant has applied for a job?

- A. Junction object between Applicant and Job

- B. Master-detail field from Applicant to Job
- C. Formula field on Applicant that references Job
- D. Lookup field from Applicant to Job

**Answer: B**

#### NEW QUESTION # 169

A developer created a custom order management app that uses an Apex class. The order is represented by an Order object and an OrderItem object that has a master-detail relationship to Order. During order processing, an order may be split into multiple orders. What should a developer do to allow their code to move some existing OrderItem records to a new Order record?

- A. Select the Allow reparenting option on the master-detail relationship.
- B. Create a junction object between OrderItem and Order.
- C. Add without sharing to the Apex class declaration.
- D. Change the master-detail relationship to an external lookup relationship.

**Answer: A**

Explanation:

Allow Reparenting in Master-Detail Relationships:

In a master-detail relationship, the child record (in this case, OrderItem) is tightly bound to the parent record (Order).

By default, child records cannot be reassigned to a different parent record in master-detail relationships.

However, enabling the "Allow Reparenting" option on the master-detail field allows the child record (OrderItem) to be reparented to a different master record (Order).

This is the correct solution as it ensures that OrderItem records can be reassigned to a new Order without changing the structure of the relationship.

Why not the other options?

A). Add without sharing to the Apex class declaration:

Adding without sharing modifies sharing rules but does not affect the ability to reparent child records. This is unrelated to the issue described.

B). Change the master-detail relationship to an external lookup relationship:

Changing the relationship type is not necessary. Additionally, doing so could introduce unintended side effects, as master-detail relationships have features like roll-up summaries that are lost with a lookup relationship.

C). Create a junction object between OrderItem and Order:

Introducing a junction object is not required. This adds unnecessary complexity and deviates from the intended use of master-detail relationships.

#### NEW QUESTION # 170

What are three capabilities of the <ltng:require> tag when loading JavaScript resources in Aura components?

Choose 3 answers

- A. Loading externally hosted scripts
- B. One-time loading for duplicate scripts
- C. Loading scripts in parallel
- D. Loading files from Documents
- E. Specifying loading order

**Answer: A,B,E**

Explanation:

Option A: Specifying loading order

True.

The <ltng:require> tag allows you to specify the order in which scripts are loaded by the sequence in the scripts attribute.

Scripts loaded using <ltng:require> are loaded only once, even if multiple components request the same script, preventing redundant loads.

You can load scripts from external URLs, such as Content Delivery Networks (CDNs), using the scripts attribute.

<ltngrequire> cannot load files from the Documents object. It loads resources from static resources or external URLs.

Scripts are loaded sequentially, not in parallel, to ensure dependencies are properly resolved.

Reference:

Include External JavaScript and CSS Libraries

Option B: One-time loading for duplicate scripts

True.

Loading JavaScript Libraries

Option D: Loading externally hosted scripts

True.

Using External Libraries

Option C: Loading files from Documents

False.

Static Resources

Option E: Loading scripts in parallel

False.

Scripts Loading Order

Conclusion:

The three capabilities are A, B, and D.
