## C-CPI-2506 Exam Cram Review, Exam C-CPI-2506 Cram Review

In spite of the high-quality of our C-CPI-2506 study braindumps, our after-sales service can be the most attractive project in our C-CPI-2506 guide questions. We have free online service which means that if you have any trouble using our C-CPI-2506 learning materials or operate different versions on the platform mistakenly, we can provide help for you remotely in the shortest time. And we know more on the C-CPI-2506 Exam Dumps, so we can give better suggestions according to your situation.

### SAP Certified Associate - Integration Developer Sample Questions (Q28-Q33):

#### NEW QUESTION # 28

Which combination of SAP BTP role collections allows a user to manage queues and topic subscriptions in SAP Event Mesh, and monitor its usage and resources?

- A. IntegrationAdmin and IntegrationDevelop
- B. EventMeshAdmin and EventMeshDevelop**
- C. SecurityAdmin and SecurityDevelop
- D. ApplicationAdmin and ApplicationDevelop

#### Answer: B

##### Explanation:

In SAP BTP, SAP Event Mesh provides messaging capabilities (queues, topics, and subscriptions) that require specific role collections to enable developers and administrators to perform tasks. SAP delivers two dedicated role collections for Event Mesh: EventMeshDeveloper:

Manages queues and topic subscriptions

Monitors Event Mesh and its queues

Performs testing of queues and message flows

EventMeshAdmin:

Includes all developer capabilities

Provides additional administration rights for lifecycle management of Event Mesh instances and configurations. When a user is assigned these role collections, they gain the ability to:

Create and manage queues and topic subscriptions.

Monitor usage and resources such as queue depth, consumers, connections, and spool size within Event Mesh.

Other provided options are incorrect:

ApplicationAdmin/ApplicationDevelop # These are not SAP Event Mesh role collections, they do not provide queue or topic subscription access.

SecurityAdmin/SecurityDevelop # These roles are tied to security configurations and do not allow Event Mesh operations.

IntegrationAdmin/IntegrationDevelop # These roles belong to SAP Integration Suite (Cloud Integration) capability, not Event Mesh. Therefore, the correct and verified answer according to SAP Integration Developer documentation is:

B). EventMeshAdmin and EventMeshDevelop

#### NEW QUESTION # 29

Which messaging patterns does SAP Event Mesh support for asynchronous communication?

- A. Publish/subscribe and point-to-point messaging
- B. Publish/subscribe and request/reply messaging
- C. Request/reply messaging and multicast messaging
- D. Point-to-point and multicast messaging

**Answer: A**

Explanation:

SAP Event Mesh supports two key asynchronous messaging patterns:

Publish/Subscribe # Producers publish an event once, multiple subscribers consume independently.

Point-to-Point (Queue-based) # Messages sent from one producer to a single consumer via a queue.

Other options are incorrect:

Request/Reply # Synchronous pattern, not the focus of Event Mesh.

Multicast messaging # Not explicitly supported; handled through Pub-Sub.

Thus, Event Mesh supports Publish/Subscribe and Point-to-Point messaging patterns.

**NEW QUESTION # 30**

Which SAP Integration Suite component delivers the Cloud Event to the "emis-s4hana-uc123" message queue?

- A. API Management
- B. Process Integration
- C. Event Mesh
- D. Open Connector

**Answer: C**

Explanation:

In SAP Integration Suite, the component responsible for delivering Cloud Events to message queues is Event Mesh.

Event Mesh handles event-driven communication and manages message queues like emis-s4hana-uc123.

Process Integration (PI/PO) is on-premise middleware, not part of Integration Suite cloud services.

API Management handles APIs, not messaging events.

Open Connectors provides connectivity to third-party SaaS apps, not queue management.

Thus, the Cloud Event is delivered to the message queue via Event Mesh.

**NEW QUESTION # 31**

You want to set up an SAP backend system through the Cloud Connector with an API provider. Which connection type do you use?

- A. Internet
- B. Cloud Integration
- C. Open Connectors
- D. On-premise

**Answer: D**

Explanation:

To connect an SAP backend system through the Cloud Connector with an API provider, you must use the on-premise connection type. The Cloud Connector acts as a link between SAP Integration Suite and on-premise systems, enabling secure and controlled access to the backend resources. The on-premise connection type allows you to specify the internal host and port of the backend system, as well as the virtual host and port that will be exposed to SAP Integration Suite. You can also define access control rules and protocols for the on-premise connection. Reference: Part 2: Connect to on-premise APIs from SAP Cloud Platform API Management Cloud Foundry Environment | SAP Blogs, How to configure SAP Cloud Connector & Create API using SCP API Management | SAP Blogs

**NEW QUESTION # 32**

In the SAP Integration Suite, where can you change the virtual host name?

- A. Design APIs

- B. Configure ? APIs
- C. Discover - APIs
- D. Settings APIs

**Answer: D**

### Explanation:

In the SAP Integration Suite, you can change the virtual host name in the Settings APIs. The Settings APIs allow you to configure various aspects of your API provider, such as the virtual host name, the base path, the authentication method, and the CORS settings.
