CompTIA PenTest+ Exam Sample Questions (Q269-Q274):

NEW QUESTION # 269

A Chief Information Security Officer wants a penetration tester to evaluate the security awareness level of the company's employees. Which of the following tools can help the tester achieve this goal?

- A. WPScan
- B. Metasploit
- C. Hydra
- D. SET

Answer: B

NEW QUESTION # 270

Which of the following protocols would a penetration tester most likely utilize to exfiltrate data covertly and evade detection?

- A. SMTP
- B. DNS
- C. HTTPS
- D. FTP

Answer: B

Explanation:

Covert data exfiltration is a crucial aspect of advanced penetration testing. Penetration testers often need to move data out of a network without being detected by the organization's security monitoring tools. Here's a breakdown of the potential methods and why DNS is the preferred choice for covert data exfiltration:

FTP (File Transfer Protocol) (Option A):

Characteristics: FTP is a clear-text protocol used to transfer files.

Drawbacks: It is easily detected by network security tools due to its lack of encryption and distinctive traffic patterns. Most modern networks block or heavily monitor FTP traffic to prevent unauthorized file transfers.

Reference:

HTTPS (Hypertext Transfer Protocol Secure) (Option B):

Characteristics: HTTPS encrypts data in transit, making it harder to inspect by network monitoring tools.

Drawbacks: While HTTPS is more secure, large amounts of unusual or unexpected HTTPS traffic can still trigger alerts on sophisticated security systems. Its usage for exfiltration depends on the network's normal traffic patterns and the ability to blend in.

SMTP (Simple Mail Transfer Protocol) (Option C):

Characteristics: SMTP is used for sending emails.

Drawbacks: Like FTP, SMTP is not inherently secure and can be monitored. Additionally, large or frequent email attachments can trigger alerts.

DNS (Domain Name System) (Option D):

Characteristics: DNS is used to resolve domain names to IP addresses and vice versa.

Advantages: DNS traffic is ubiquitous and often less scrutinized than other types of traffic. Data can be encoded into DNS queries and responses, making it an effective covert channel for exfiltration.

Conclusion: DNS tunneling stands out as the most effective method for covert data exfiltration due to its ability to blend in with normal network traffic and avoid detection by conventional security mechanisms. Penetration testers utilize this method to evade scrutiny while exfiltrating data.

NEW QUESTION # 271

A company that uses an insecure corporate wireless network is concerned about security. Which of the following is the most likely tool a penetration tester could use to obtain initial access?

- A. Metasploit
- B. Nmap
- **C. Responder**
- D. Netcat

Answer: C

Explanation:

Comprehensive and Detailed Explanation:

Given an insecure wireless network (e.g., open or poorly secured Wi-Fi), a practical initial access technique is to capture or poison name resolution/authentication requests from client systems once they are on that network. Responder is designed to perform LLMNR/NBT-NS/MDNS poisoning and capture NTLM authentication attempts and other credential material on a local network segment. On an insecure Wi-Fi network an attacker can either join the network or run a rogue AP and then run Responder to capture credentials from connected clients - a typical and effective initial-access method in such scenarios.

Why not the others:

* B. Metasploit - a general exploitation framework; useful after finding a vulnerable service, but not specifically the most-likely initial tool on an insecure Wi-Fi.

* C. Netcat - a raw TCP/UDP utility (listeners/shells); useful post-exploitation but not for capturing broadcast name resolution requests.

* D. Nmap - a scanner to discover hosts/ports; helpful reconnaissance, but not directly used to capture credentials on a local insecure wireless segment.

CompTIA PT0-003 Mapping: Wireless/host-based attacks and network credential-capture techniques (evil twin/rogue AP and LLMNR/NetBIOS poisoning).

NEW QUESTION # 272

A penetration tester is conducting reconnaissance on a target network. The tester runs the following Nmap command: `nmap -sv -sT -p - 192.168.1.0/24`. Which of the following describes the most likely purpose of this scan?

- A. Attack path mapping
- B. User enumeration
- C. OS fingerprinting
- **D. Service discovery**

Answer: D

Explanation:

The Nmap command `nmap -sv -sT -p- 192.168.1.0/24` is designed to discover services on a network. Here is a breakdown of the command and its purpose:

* Command Breakdown:

* `nmap`: The network scanning tool.

* `-sV`: Enables service version detection. This option tells Nmap to determine the version of the services running on open ports.

* `-sT`: Performs a TCP connect scan. This is a more reliable method of scanning as it completes the TCP handshake but can be easily detected by firewalls and intrusion detection systems.

* `-p-`: Scans all 65535 ports. This ensures a comprehensive scan of all possible TCP ports.

* `192.168.1.0/24`: Specifies the target network range (subnet) to be scanned.

* Purpose of the Scan:

* Service Discovery : The primary purpose of this scan is to discover which services are running on the network's hosts and determine their versions. This information is crucial for identifying potential vulnerabilities and understanding the network's exposure.

* References:

* Service discovery is a common task in penetration testing to map out the network services and versions, as seen in various Hack The Box (HTB) write-ups where comprehensive service enumeration is performed before further actions.

Conclusion: The `nmap -sv -sT -p- 192.168.1.0/24` command is most likely used for service discovery, as it aims to identify all running services and their versions on the target subnet.

NEW QUESTION # 273

A penetration tester is performing reconnaissance for a web application assessment. Upon investigation, the tester reviews the

robots.txt file for items of interest.

INSTRUCTIONS

Select the tool the penetration tester should use for further investigation.

Select the two entries in the robots.txt file that the penetration tester should recommend for removal.

Answer:

Explanation:

The tool that the penetration tester should use for further investigation is WPScan. This is because WPScan is a WordPress vulnerability scanner that can detect common WordPress security issues, such as weak passwords, outdated plugins, and misconfigured settings. WPScan can also enumerate WordPress users, themes, and plugins from the robots.txt file.

The two entries in the robots.txt file that the penetration tester should recommend for removal are:

* Allow: /admin

* Allow: /wp-admin

These entries expose the WordPress admin panel, which can be a target for brute-force attacks, SQL injection, and other exploits. Removing these entries can help prevent unauthorized access to the web application's backend. Alternatively, the penetration tester can suggest renaming the admin panel to a less obvious name, or adding authentication methods such as two-factor authentication or IP whitelisting.
