Palo Alto Networks XSIAM Analyst Sample Questions (Q16-Q21):

NEW QUESTION # 16

What is the primary function of hunting in Cortex XSIAM?

Response:

- A. Performing backups
- **B. Searching for indicators across datasets**
- C. Creating manual scoring policies
- D. Uploading endpoint profiles

Answer: B

NEW QUESTION # 17

Which of the following is NOT a task type in Cortex XSIAM playbooks?

Response:

- A. Conditional task
- B. Manual task
- **C. Reinforcement task**
- D. Automation script

Answer: C

NEW QUESTION # 18

An analyst conducting a threat hunt needs to collect multiple files from various endpoints. The analyst begins the file retrieval process by using the Action Center, but upon review of the retrieved files, notices that the list is incomplete and missing files, including kernel files.

What could be the reason for the issue?

- **A. The file retrieval policy applied to the endpoints may restrict access to certain system or kernel files**
- B. The analyst must manually retrieve kernel files by accessing the machine directly
- C. The retrieval process is limited to 500 MB in total file size
- D. The endpoint agents were in offline mode during the file retrieval process, causing some files to be skipped

Answer: A

Explanation:

The correct answer is A - The file retrieval policy applied to the endpoints may restrict access to certain system or kernel files. Cortex XSIAM and XDR implement security policies and permissions that may restrict the retrieval of sensitive system files, including kernel files, for safety and compliance reasons. When a file retrieval action is initiated, the endpoint policy controls which files are accessible; kernel and other protected files are often excluded from remote retrieval actions to prevent accidental or unauthorized access.

"The file retrieval policy controls which files can be remotely collected from endpoints. Sensitive files, such as kernel or system files, may be restricted by policy and are not accessible through standard remote retrieval actions." NEW QUESTION # 19

An incident context tab shows:

- User = jsmith@corp
- Affected endpoints = 2
- Alerts = file modification, process injection

What can be concluded?

Response:

- A. This is likely an HR system error
- B. The incident links multiple alerts and assets to the same identity
- C. Alerts are isolated and unrelated
- D. The same user was involved across multiple assets

Answer: B,D

NEW QUESTION # 20

Which two statements apply to IOC rules? (Choose two)

- A. They can be excluded using suppression rules but not alert exclusions.
- B. They can have an expiration date of up to 180 days.
- C. They can be used to detect a specific registry key.
- D. They can be uploaded using REST API.

Answer: C,D

Explanation:

Correct answers are A and D.

* Option A (Correct): IOC rules within Cortex XSIAM can detect specific indicators such as files, registry keys, IP addresses, hashes, and URLs.

* Option D (Correct): IOC rules can indeed be uploaded or updated programmatically using REST APIs, enabling automation and bulk management.

Options B and C are incorrect due to the following reasons:

* Expiration dates for IOC rules vary depending on system settings, and there is no strict 180-day limit explicitly defined in the provided documentation.

* IOC rules are managed through general alert exclusion mechanisms as well as through suppression rules.

"IOC rules can detect specific files, hashes, registry keys, IP addresses, and URLs and can be managed programmatically via REST API." Document Reference: EDU-270c-10-lab-guide_02.docx (1).pdf Exact Page: Page 33 (Alerting and Detection section)
