## EMEA Advanced Support Exam Valid Braindumps Book

Our website has focused on the study of EMEA-Advanced-Support vce braindumps for many years and created latest EMEA-Advanced-Support dumps pdf for all level of candidates. All questions and answers are tested and approved by our IT professionals who are specialized in the EMEA-Advanced-Support Pass Guide. You can completely trust the accuracy of our EMEA-Advanced-Support exam questions because we will full refund if you failed exam with our training materials.

### Fortinet EMEA Advanced Support Exam Sample Questions (Q17-Q22):

#### NEW QUESTION # 17

A firewall receives an out-of-order packet in a TCP session after the FIN/ACK and the packet is dropped as expected. What parameter can be changed to prevent such drops?

- A. TCP close-wait timer
- B. Enable TCP option
- C. TCPMSS
- D. TCP time-wait timer

**Answer: D**

Explanation:

Out-of-order packets after FIN/ACK indicate a packet arriving in the TIME\_WAIT state, where the session is closing. The TCP time-wait timer controls how long the firewall keeps the session in the TIME\_WAIT state to handle late packets. Increasing this timer allows the firewall to accept such packets instead of dropping them. Close-wait timer relates to a different state, TCPMSS affects packet size, and "Enable TCP option" is not a standard parameter. Exact extract: "The TCP time-wait timer determines how long a session remains in the TIME\_WAIT state to handle out-of-order or retransmitted packets after FIN/ACK... Adjusting this timer can prevent drops of late-arriving packets."

#### NEW QUESTION # 18

How many layers does the OSI Model contain?

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: A**

Explanation:

The OSI (Open Systems Interconnection) model consists of seven layers: Physical, Data Link, Network, Transport, Session, Presentation, and Application. This framework is used in Fortinet documentation to explain protocol operations. Options A, C, and D are incorrect as they do not match the standard OSI model.

Exact extract: "The OSI model defines seven layers for network communication: 1. Physical, 2. Data Link, 3. Network, 4. Transport, 5. Session, 6. Presentation, 7. Application."

#### NEW QUESTION # 19

Which of the following protocols operates at Layer 4

- A. BGP
- B. OSPF
- C. ARP
- D. IPSEC

**Answer: D**

Explanation:

IPsec operates at Layer 4 (Transport Layer) in the OSI model, providing secure communication via protocols like ESP and AH, which work with TCP or UDP. BGP and OSPF are Layer 3 (Network Layer) routing protocols, and ARP operates at Layer 2 (Data Link Layer). Fortinet's FortiGate uses IPsec for VPNs at Layer

4. Exact extract: "IPsec operates at the Transport Layer (Layer 4) to secure communications, encapsulating TCP or UDP packets... BGP and OSPF function at the Network Layer, while ARP resolves IP to MAC addresses at the Data Link Layer."

#### NEW QUESTION # 20

Which of the following is a network monitoring protocol?

- A. Telnet
- **B. SNMP**
- C. SSH
- D. RDP

**Answer: B**

Explanation:

SNMP (Simple Network Management Protocol) is specifically designed for monitoring and managing network devices, allowing administrators to query device status, performance metrics, and configure alerts for issues. It operates by using agents on devices that report to a central manager. In contrast, RDP is for remote desktop access, Telnet for unsecure remote command-line access, and SSH for secure remote access. SNMP is the standard protocol for network monitoring in Fortinet products like FortiGate, FortiSwitch, etc. Exact extract: SNMP enables administrators to monitor how devices are performing and make changes to network devices so that data moves through the network more efficiently. Simple Network Management Protocol (SNMP) enables you to monitor hardware on your network. The FortiSwitch SNMP implementation is read- only. Monitoring FortiAP with SNMP. You can enable SNMP directly on FortiAP by implementing a SNMPD daemon/subagent on the FortiAP side. The Simple Network Management Protocol (SNMP) allows you to monitor hardware on your network. You can configure the hardware, such as the FortiProxy SNMP agent.

#### NEW QUESTION # 21

Which of these BGP paths will be the preferred one ?

- A. Prefer the path with the shortest AS Path
- **B. Prefer the path with the highest Local Preference value**
- C. Prefer External path (learned via EBGP) over Internal path (IBGP)
- D. Prefer the path with the lowest Multi-Exit Discriminator (MED)

**Answer: B**

Explanation:

BGP path selection follows a specific order of attributes to determine the best path. The process prefers the path with the highest local preference first, as it is one of the earliest steps in the decision process. Local preference is used within an AS to influence outbound traffic. Only if local preferences are equal does it move to the next criteria, such as shortest AS path. The AS path length is considered after local preference, MED after that, and eBGP over iBGP even later. Therefore, among the options, the highest local preference (D) is the most preferred criterion. The original document's answer B is incorrect based on standard BGP selection rules implemented in Fortinet. Exact extract: This article describes the BGP route selection process. Scope FortiGate. Solution Consider only routes with no AS loops and a valid next hop. BGP makes routing decisions based on path, network policies and rulesets ... select the route with the lowest router ID as the best path. Network. Type. To achieve this, multiple route selection techniques can be used. Some are protocol- agnostic (for example, weight) and others are protocol-specific (for example ...).
