#### NEW QUESTION # 87

Which of the following can you do with an SAP Datasphere Data Flow? Note: There are 3 correct answers to this question.

- A. Delete records from a target table.
- B. Integrate data from different sources into one table.
- C. Use a Python script for data transformation.
- D. Write data to a table in a different SAP Datasphere tenant.
- E. Fill different target tables in parallel.

**Answer: B,C,E**

Explanation:

An SAP Datasphere Data Flow is a highly versatile and powerful tool for data integration, transformation, and loading. With a Data Flow, you can effectively integrate data from different sources into one table (B). This is a fundamental capability, allowing you to combine data from various tables, views, or even external connections, apply transformations, and consolidate it into a single target table. Another advanced capability is to fill different target tables in parallel (D). Data Flows are designed to handle complex scenarios efficiently, and this parallelism optimizes performance when you need to populate multiple destination tables simultaneously from a single flow. Furthermore, Data Flows support extensibility, allowing you to use a Python script for data transformation (E). This enables advanced, custom data manipulation logic that might not be available through standard graphical operations, providing immense flexibility for complex business rules. Writing data to a different Datasphere tenant (A) is not a direct capability of a Data Flow, and deleting records from a target table (C) is typically handled via specific operations within the target table's management or through SQL scripts rather than a standard data flow write operation.
