GIAC Global Industrial Cyber Security Professional (GICSP) Sample Questions (Q87-Q92):

NEW QUESTION # 87

A keyed lock on a facility's back door is an example of which type of control?

- A. Delaying
- B. Responsive
- C. Avoidant
- D. Corrective

Answer: A

Explanation:

A keyed lock is a delaying control (D) because it physically slows down or impedes unauthorized access to a facility, giving security personnel more time to respond.

Avoidant controls (A) prevent risk by eliminating it.

Responsive controls (B) act after an incident occurs.

Corrective controls (C) fix or restore systems after an incident.

GICSP emphasizes physical delaying controls as part of defense-in-depth strategies.

NEW QUESTION # 88

What is a key consideration when developing a disaster recovery plan for an ICS environment?

Response:

- A. Implementing open-source software for cost savings
- **B. Minimizing disruption to critical operations and physical processes**
- C. Increasing the amount of data generated during normal operations
- D. Ensuring real-time data replication to cloud storage

Answer: B

NEW QUESTION # 89

From the GIAC directory on the Desktop, open gicsp.pcap in Wireshark and filter for USB Capture data.

Analyze the Modbus serial data by applying the "leftover capture data" as a column in Wireshark. In packet 28, what read function is requested? Use the protocol description in the image.

- A. 0x07
- B. 0x05
- C. 0x04
- D. 0x02
- E. 0x01
- F. 0x06
- G. 0x08
- **H. 0x03**
- I. 0x09
- J. 0x0a

Answer: H

Explanation:

The question requires identifying the Modbus function code in a specific packet (packet 28) from a USB capture analyzed in Wireshark. Modbus function codes are hexadecimal values that indicate specific commands such as reading coils, holding registers, or writing data.

From the GICSP domain on ICS Protocols and Network Security, Modbus is a common industrial protocol with well-known function codes. For example:

0x01 = Read Coils

0x02 = Read Discrete Inputs

0x03 = Read Holding Registers

0x04 = Read Input Registers

0x05 = Write Single Coil

0x06 = Write Single Register

0x08 = Diagnostics

0x09, 0x0a, 0x07 correspond to less common or vendor-specific functions.

The "leftover capture data" likely refers to the actual Modbus payload column, which can be decoded to read the function code at the beginning of the PDU (Protocol Data Unit).

Based on standard practice and the protocol description, packet 28's read function is typically 0x03, which is the function code for "Read Holding Registers," a common read request.

This matches GICSP training material on analyzing ICS network captures and identifying Modbus function codes for incident response and protocol inspection.

NEW QUESTION # 90

Which of the following is a common vulnerability of the DNP3 protocol used in ICS environments?

Response:

- A. Lack of real-time communication capabilities
- B. Inflexibility in adapting to wireless networks
- **C. Inability to encrypt data**
- D. Limited compatibility with modern SCADA systems

Answer: C

NEW QUESTION # 91

An administrator relaxes the password policy during disaster recovery operations. What is the result of this action?

- A. Negative effect on recovery point objective (RPO)
- B. Reduced insurance needs
- **C. Increased risk**
- D. Positive effect on recovery time objective (RTO)

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Relaxing password policies during disaster recovery often leads to increased risk (C) by weakening authentication controls and potentially allowing unauthorized access.

Recovery Point Objective (RPO) (A) relates to data loss tolerance and is unlikely directly affected by password policies.

Recovery Time Objective (RTO) (B) relates to restoration speed, and while relaxed policies may speed access, this is outweighed by security risk.

Reduced insurance needs (D) is not a direct consequence of relaxed security policies.

GICSP stresses that even during emergencies, security controls should be maintained to prevent additional vulnerabilities.
