IBM MQ v9.4 Administrator - Professional Sample Questions (Q161-Q166):

NEW QUESTION # 161

In IBM MQ, which method best explains the use of SSL/TLS secured channels between queue managers, including how digital certificates, cipher specifications, and authentication rules are applied to encrypt messages, prevent unauthorized access, and ensure data integrity during transmission across networks?

- A. Secured channels use SSL/TLS certificates, cipher specs, and authentication rules to encrypt communication, prevent unauthorized access, and ensure integrity of messages between queue managers
- B. SSL/TLS automatically secures all channels without configuration
- C. SSL/TLS is only applied to client connections and not queue manager channels
- D. SSL/TLS is optional and only affects logging messages

Answer: A

Explanation:

SSL/TLS-secured channels use certificates and cipher specs to encrypt messages and verify identities, protecting message confidentiality and integrity while preventing unauthorized access between queue managers.

NEW QUESTION # 162

While administering an IBM MQ cluster spread across multiple business units, the administrator wants to avoid a single queue manager becoming a bottleneck and ensure that workload is evenly distributed across all available instances without requiring manual routing decisions. Which MQ feature should be used to achieve this?

- A. Using cluster workload balancing with multiple queue managers in the same cluster
- B. Configuring dedicated sender-receiver channels without clustering
- C. Implementing message selectors on consumers for manual load sharing
- D. Defining a single local queue and manually assigning applications to connect

Answer: A

Explanation:

Cluster workload balancing automatically spreads messages across available queue managers in a cluster, removing bottlenecks and ensuring efficient distribution.

NEW QUESTION # 163

In IBM MQ, when designing a system for global enterprise applications that require reliable communication across multiple regions, which feature allows messages to be routed automatically to available queue managers in a cluster while ensuring load balancing and minimal configuration changes at the sending application side?

- A. Multi-instance queue managers that provide failover but do not handle routing across regions.
- B. MQ Clustering which dynamically routes messages to any available queue manager in the cluster, supporting load balancing and high availability.
- C. Queue Grouping that distributes messages among consumers within the same queue but does not route across multiple queue managers.
- D. Dead Letter Queues that capture undelivered messages but do not provide routing capabilities.

Answer: B

Explanation:

MQ Clustering enables dynamic routing and load balancing across multiple queue managers, allowing enterprise applications to communicate efficiently without manual configuration of target queues.

NEW QUESTION # 164

In IBM MQ, when integrating multiple enterprise applications across different platforms, which configuration ensures that messages can be securely transmitted, automatically retried in case of temporary network failures, and logged for audit purposes without manual intervention by administrators?

- A. Using point-to-point queues without encryption but enabling application-level retries
- B. Implementing transient queues with in-memory storage and no logging
- C. Configuring persistent messages with defined channels, SSL/TLS encryption, and built-in MQ logging mechanisms
- D. Using non-persistent messages with default channels and manual retry scripts

Answer: C

Explanation:

Persistent messages with SSL/TLS-secured channels and MQ logging ensure reliability, security, and traceability, making it ideal for multi-platform enterprise integrations.

NEW QUESTION # 165

IBM MQ supports message selectors for filtering messages. Which option correctly explains how message selectors function, including their limitations and typical usage in message-driven applications?

- A. Message selectors are applied at the queue manager level and filter messages before they enter any queue, affecting all consuming applications.

- B. Message selectors are expressions evaluated by the queue manager to allow an application to receive only messages that match specific criteria, based on message headers or properties.
- C. Message selectors encrypt messages selectively to ensure secure delivery to specific applications.
- D. Message selectors automatically archive messages that do not match criteria for later processing.

Answer: B

Explanation:

Message selectors are used by consuming applications to filter messages at the time of retrieval. They rely on header fields or properties and do not affect the queue itself.

NEW QUESTION # 166
