CompTIA SY0-701 Realistic Official Study Guide Pass Guaranteed Quiz

It is well acknowledged that people who have a chance to participate in the simulation for the real SY0-701 exam, they must have a fantastic advantage over other people to get good grade in the SY0-701 exam. Now, it is so lucky for you to meet this opportunity once in a blue. We offer you the simulation test with the Software version of our SY0-701 Preparation dumps in order to let you be familiar with the environment of test as soon as possible.

CompTIA Security+ Certification Exam Sample Questions (Q1027-Q1032):

NEW QUESTION # 1027

An organization wants a third-party vendor to do a penetration test that targets a specific device.

The organization has provided basic information about the device. Which of the following best describes this kind of penetration test?

- A. Known environment
- B. Partially known environment
- C. Integrated
- D. Unknown environment

Answer: B

Explanation:

A partially known environment is a type of penetration test where the tester has some information about the target, such as the IP

address, the operating system, or the device type. This can help the tester focus on specific vulnerabilities and reduce the scope of the test. A partially known environment is also called a gray box test.

NEW QUESTION # 1028

A company is experiencing issues with employees leaving the company for a competitor and taking customer contact information with them. Which of the following tools will help prevent this from reoccurring?

- A. IDS
- B. NAC
- C. UBA
- D. FIM

Answer: C

Explanation:

User Behavior Analytics (UBA) monitors user activities and detects anomalous behavior such as unauthorized data access or exfiltration, including when employees attempt to copy sensitive customer contact information before leaving. UBA can alert security teams to insider threats proactively.

File Integrity Monitoring (FIM) (A) detects unauthorized changes to files but is less effective against data exfiltration by insiders.

Network Access Control (NAC) (B) controls device access to the network, and Intrusion Detection Systems (IDS) (C) detect suspicious network activity but do not specifically analyze user behaviors.

UBA is a critical tool for insider threat detection covered in Security Operations#6:Chapter 14 CompTIA Security+ Study Guide#.

NEW QUESTION # 1029

A security analyst finds a rogue device during a monthly audit of current endpoint assets that are connected to the network. The corporate network utilizes 802.1X for access control. To be allowed on the network, a device must have a Known hardware address, and a valid user name and password must be entered in a captive portal. The following is the audit report:

IP address	MAC	Username
10.10.04.42	EE-AC-11-F1-E4-84	user1
10.10.04.30	EE-AC-11-F2-43-84	user2
10.10.04.39	EE-BB-5A-12-43-84	user2
10.10.04.30	EE-BB-5A-F0-43-84	user4
10.10.04.22	EE-AC-11-F1-E4-84	user3
10.10.04.24	EE-20-5A-F0-43-84	user3

Which of the following is the most likely way a rogue device was allowed to connect?

- A. A DMCP failure caused an incorrect IP address to be distributed
- B. DNS hijacking let an attacker intercept the captive portal traffic.
- C. An administrator bypassed the security controls for testing.
- D. A user performed a MAC cloning attack with a personal device.

Answer: D

Explanation:

The most likely way a rogue device was able to connect to the network is through a MAC cloning attack. In this attack, a personal device copies the MAC address of an authorized device, bypassing the 802.1X access control that relies on known hardware addresses for network access. The matching MAC addresses in the audit report suggest that this technique was used to gain unauthorized network access.

NEW QUESTION # 1030

A company's accounting department receives an urgent payment message from the company's bank domain with instructions to wire transfer funds. The sender requests that the transfer be completed as soon as possible.

Which of the following attacks is described?

- A. Impersonation
- B. Business email compromise
- C. Spear phishing

- D. Vishing

Answer: B

Explanation:

This is a classic example of Business Email Compromise (BEC), where attackers spoof or compromise trusted email accounts to trick employees into performing unauthorized financial transactions.

Vishing (B) is voice phishing, spear phishing (C) targets individuals with customized messages, and impersonation (D) is a general term for identity deception but BEC specifically describes financial fraud via email.

BEC is a major threat covered in the Threats domain of SY0-701#6:Chapter 2+CompTIA Security+ Study Guide#

NEW QUESTION # 1031

Which of the following vulnerabilities is exploited when an attacker overwrites a register with a malicious address?

- A. Buffer overflow
- B. VM escape
- C. SQL injection
- D. Race condition

Answer: A

Explanation:

Explanation

A buffer overflow is a vulnerability that occurs when an application writes more data to a memory buffer than it can hold, causing the excess data to overwrite adjacent memory locations. A register is a small storage area in the CPU that holds temporary data or instructions. An attacker can exploit a buffer overflow to overwrite a register with a malicious address that points to a shellcode, which is a piece of code that gives the attacker control over the system. By doing so, the attacker can bypass the normal execution flow of the application and execute arbitrary commands.
