## IBM C1000-200 Reliable Cram Materials, C1000-200 Sample Questions Answers

Are you tired of preparing different kinds of exams? Are you stuck by the aimless study plan and cannot make full use of sporadic time? Are you still overwhelmed by the low-production and low-efficiency in your daily life? If your answer is yes, please pay attention to our C1000-200 guide torrent, because we will provide well-rounded and first-tier services for you, thus supporting you obtain your dreamed C1000-200 certificate and have a desired occupation. We can say that our C1000-200 test questions are the most suitable for examinee to pass the exam, you will never regret to buy it.

### IBM MQ v9.4 Administrator - Professional Sample Questions (Q244-Q249):

#### NEW QUESTION # 244

If an IBM MQ message must be processed exactly once, ensuring no duplication or loss during failure scenarios, which combination of message properties and MQ capabilities is most appropriate to implement?

- A. Persistent messages within a unit of work (transaction) committed to the queue manager
- B. Non-persistent messages with asynchronous delivery
- C. Messages sent to temporary queues without acknowledgment
- D. Alias queues with manual redirection

**Answer: A**

Explanation:

Using persistent messages with MQ transactions ensures exactly-once delivery semantics. If a failure occurs before the transaction commit, the message is not lost or duplicated.

#### NEW QUESTION # 245

When an IBM MQ message cannot be delivered to its intended target queue due to misconfiguration, full queues, or unavailable queue managers, which component captures these undelivered messages and provides administrators with the ability to inspect, troubleshoot, and redirect them appropriately?

- A. Alias queue forwarding
- B. Backout queue for retry
- C. Temporary queue deletion mechanism
- D. Dead-letter queue (DLQ)

**Answer: D**

Explanation:

The Dead-letter queue (DLQ) stores undelivered messages, allowing administrators to investigate failures, correct issues, and safely re-route messages, ensuring no data loss.

#### NEW QUESTION # 246

When performing backup and recovery of an IBM MQ queue manager in a production environment, which approach ensures minimal downtime and complete restoration of messages, subscriptions, and configurations in case of system failure?

- A. Cloning the queue manager on a different server without stopping the active instance
- B. Relying solely on client-side message logs
- C. Copying only the queue manager configuration files without messages
- D. Using MQ's in-built backup utilities or taking a filesystem-level backup of the queue manager's data directory including logs and journal files

**Answer: D**

Explanation:

A complete backup of the queue manager's data directory, including logs and journal files, ensures that messages, subscriptions, and configurations can be fully restored with minimal downtime.

### NEW QUESTION # 247

In IBM MQ, why is dead-letter queue (DLQ) configuration critical for message handling, and what types of situations cause messages to be routed to a DLQ instead of their intended destination?

- A. DLQ is used for storing successfully delivered messages as backup; messages are sent there after normal processing
- B. DLQ acts as a temporary buffer to speed up message delivery during high traffic
- C. DLQ holds messages that cannot be delivered due to reasons such as queue full, non-existent queue, or network issues, preventing message loss
- D. DLQ is used to store messages that are non-persistent and will expire if not consumed quickly

**Answer: C**

Explanation:

Dead-letter queues capture undeliverable messages due to errors like full queues or unavailable destinations, ensuring no messages are lost and administrators can troubleshoot delivery issues.

### NEW QUESTION # 248

In a scenario where multiple applications are consuming messages from the same queue at the same time, which IBM MQ feature ensures that only one application can process a specific message at a time while other messages are still available for processing by other consumers, maintaining consistency and avoiding duplicate processing?

- A. Syncpoint-controlled GET operations that lock messages during processing
- B. Persistent messages with automatic replication
- C. Message groups allowing multiple consumers to read the same message
- D. Exclusive queues that allow only one application to access all messages

**Answer: A**

Explanation:

Syncpoint-controlled GET operations lock individual messages while processing, ensuring that each message is delivered to only one consumer at a time and avoiding duplication.

### NEW QUESTION # 249

.....

If you purchase our study materials to prepare the C1000-200 Exam, your passing rate will be much higher than others. Also, the operation of our study material is smooth and flexible and the system is stable and powerful. You can install the C1000-200 exam guide on your computers, mobile phone and other electronic devices. There are no restrictions to the number equipment you install. In short, it depends on your own choice. We sincerely hope that you can enjoy the good service of our products.
