最新的CCSK認證考試的題目與答案

VCESoft的CCSK考古題是你準備CCSK認證考試時最不能缺少的資料。這個資料的價值等同於其他一切的與考試相關的參考書。這種說法並不誇張。只要你用了它你就會發現，這一切都是真的。

雲安全聯盟（CSA）是一家非營利組織，致力於促進雲計算安全的最佳實踐和教育。CSA開發了雲安全知識證書（CCSK），作為驗證個人在雲安全方面專業知識和能力的一種方式。CCSK被全球公認為雲安全認證的標準。

最新的 Cloud Security Knowledge CCSK 免費考試真題 (Q83-Q88):

問題 #83

Which of the authentication is more secured?

- A. Multifactor Authentication
- B. Password Authentication
- C. Single Sign-on
- D. Biometric Authentication

答案：A

解題說明：

Multifactor authentication is more secured than the rest because it has more than one aspect to authentication Multifactor authentication is composed of, at a minimum, two of the following aspects- something you know, something you are, or something

you have. Something you know can be a password, passphrase, and so on. Something you have can be something like a number-generating transmit a number or fob, a smartphone capable of receiving text messages, or even a phone that can receive a call and then to the individual but that is only accessible from a very specific phone number. Something you are is a biometric trait of yourself, as a living creature. This could be as unique and specific as your DNA fingerprint, or as cursorily general as a photograph.

問題 #84

In Identity and Access Management (IAM) containment, why is it crucial to understand if an attacker escalated their identity?

- A. It aids in determining the source IP of the attacker.
- B. Because it simplifies the recovery process and increases the response time.
- C. To facilitate the eradication of malware.
- D. To prevent further unauthorized access and limit the management plane blast radius.

答案： D

解題說明：

Privilege escalation is a major cloud security risk because attackers can:

- * Gain administrative access to cloud environments.
- * Modify security configurations, disable logs, and exfiltrate sensitive data.
- * Expand the attack blast radius, compromising multiple cloud resources.

To mitigate identity escalation threats, security teams must:

- * Implement strong IAM policies with least privilege access.
- * Use Multi-Factor Authentication (MFA) and Just-in-Time (JIT) access.
- * Monitor IAM logs for unusual privilege escalations and lateral movements.

This is detailed in:

- * CCSK v5 - Security Guidance v4.0, Domain 12 (Identity, Entitlement, and Access Management)
- * Cloud Controls Matrix (CCM) - IAM Controls and Privilege Escalation Prevention.

問題 #85

Which of the following uses security and encryption as means to prevent unauthorized copying and limitations on distribution to only those who pay?

- A. Data Dispersion
- B. Digital Rights Management (DRM)
- C. Data Encryption
- D. IPSEC

答案： B

解題說明：

Digital rights management (DRM) was designed to focus on security and encryption as a means of preventing unauthorized copying and limitations on distribution of content to only those authorized (purchasers).

問題 #86

Which of the following represents a benefit of using serverless computing for new workload types?

- A. Requires short-term commitments and defers upfront costs
- B. Large initial configuration is not required
- C. Full control over underlying server environments
- D. Automatic scaling and reduced operational overhead

答案： D

解題說明：

Serverless computing (Function as a Service - FaaS) is designed for auto-scaling, high availability, and reduced management overhead. It enables developers to focus on writing code without managing the underlying infrastructure. This makes it an ideal solution for new or unpredictable workloads.

As explained in CSA Security Guidance v4.0 - Domain 1: Cloud Computing Concepts and Architectures

:

"Serverless computing abstracts infrastructure management and allows automatic scaling of application functions in response to demand. This reduces operational overhead and enables teams to deploy scalable solutions rapidly." (CSA Security Guidance v4.0, Domain 1: Cloud Computing Concepts and Architectures) Why not the others?

- * A. While cost benefits exist, it's not the core benefit of serverless.
- * C. Configuration may be minimal, but not exclusive to serverless.
- * D. Serverless removes control over the underlying server environment.

問題 #87

In the context of server-side encryption handled by cloud providers, what is the key attribute of this encryption?

- A. The data is not encrypted in transit.
- **B. The data is encrypted using customer or provider keys after transmission to the cloud.**
- C. The data is encrypted before transmission to the cloud.
- D. The data is encrypted using symmetric encryption.

答案: B

解題說明:

In the context of server-side encryption handled by cloud providers, the data is encrypted after transmission to the cloud using either provider-managed keys or customer-managed keys. The cloud provider takes responsibility for encrypting the data when it is stored in the cloud, ensuring that the data at rest is protected.

Server-side encryption typically uses symmetric encryption for performance reasons, but this attribute is not what defines the encryption process. Also, server-side encryption focuses on protecting data once it's in the cloud, not before transmission.

Encryption in transit is typically handled separately from server-side encryption and applies to data as it moves between the client and the cloud.

問題 #88
