最も少ない時間と精力を使ってSAPの試験に合格したいのですか？我々のC_CPI_2506資料はIT専門家たちの数年の努力成果ですから、あなたの需要を満たすことができます。質高いC_CPI_2506資料だけでなく、行き届いたサービスを提供します。意向があれば、弊社のホームページをご覧ください。

SAP C_CPI_2506 認定試験の出題範囲:

トピック	出題範囲
トピック 1	SAP統合スイートの概要: このセクションでは、統合コンサルタントのスキルを評価し、SAP統合スイートの基礎概念を網羅します。スイートの機能、アプリケーション接続における役割、そして現代のクラウドベースの統合シナリオにおける関連性について理解を深めます。
トピック 2	クラウド統合の実装: このセクションでは、統合コンサルタントのスキルを評価し、クラウド統合フローの設計と展開方法を検証します。SAPのクラウド環境において、効率的で安全かつ信頼性の高い統合プロセスを構築するための統合シナリオの作成、接続性の管理、ベストプラクティスの適用に重点が置かれます。

トピック 3	• SAP Event Mesh: この試験セクションでは、ソリューションアーキテクトのスキルを評価し、SAP Event Meshを用いたイベントドリブン型統合のサポートに焦点を当てます。非同期通信、イベントパブリッシング、サブスクリプションモデルの重要性に焦点を当て、組織がスケーラブルで分離されたシステムを構築できるよう支援します。
トピック 4	• API管理: このセクションでは、ソリューションアーキテクトのスキルを評価し、SAPエコシステムにおけるAPI管理に焦点を当てます。APIのプロビジョニング、ライフサイクル管理、セキュリティポリシー、監視といったトピックを網羅し、受験者がエンタープライズ統合のニーズに応じてAPIを効果的に管理できる能力を養います。

C_CPI_2506日本語参考 & C_CPI_2506模擬対策

JapancertのSAP C_CPI_2506問題集は専門家たちが数年間で過去のデータから分析して作成されて、試験にカバーする範囲は広くて、受験生の皆様のお金と時間を節約します。我々C_CPI_2506問題集の通過率は高いので、90%の合格率を保証します。あなたは弊社の高品質SAP C_CPI_2506試験資料を利用して、一回に試験に合格します。

SAP Certified Associate - Integration Developer 認定 C_CPI_2506 試験問題 (Q56-Q61):

質問 # 56

What do you use in an integration flow to handle unexpected errors?

- A. Exception-handling subprocesses
- B. Exception handler integration flow elements
- C. Status code checks
- D. Try-catch subprocesses

正解: A

解説:

In SAP Cloud Integration (part of Integration Suite), error handling within integration flows is implemented using: Exception Subprocesses # Dedicated subprocesses triggered by an Error Start Event to handle unexpected runtime exceptions. These allow logging, error notifications, or compensating logic.
Other options:
Try-Catch subprocesses # Not a modeling construct in SAP CPI.
Exception handler integration flow elements # Not a standard artifact; error handling is done with exception subprocesses.
Status code checks # Useful for response validation but not full error handling.
Thus, the correct answer is Exception-handling subprocesses.

質問 # 57

Which architectural pattern does SAP Integration Suite, Advanced Event Mesh primarily support for asynchronous communication?

- A. Message Queue pattern
- B. Microservices Architecture pattern
- C. Event-Driven Architecture (EDA) pattern
- D. Publish-Subscribe pattern

正解: C

解説:

SAP Integration Suite, Advanced Event Mesh (formerly SAP Event Mesh) is designed to facilitate asynchronous communication in distributed systems, primarily supporting the Event-Driven Architecture (EDA) pattern. This architectural pattern enables systems to produce, detect, consume, and react to events in real time, allowing loosely coupled, scalable, and resilient integration across

applications and services.

Why Option C is Correct:

* Event-Driven Architecture (EDA) in SAP Advanced Event Mesh: SAP Integration Suite, Advanced Event Mesh is a cloud-based messaging service that enables event-driven communication by allowing applications to publish and subscribe to events asynchronously. It supports real-time event streaming and processing, which aligns with the core principles of EDA. In EDA, events are generated when something of interest occurs (e.g., a state change in a business process), and other systems or services react to these events without direct coupling.

* SAP Reference: According to the SAP Integration Suite Documentation and SAP Advanced Event Mesh Developer Guide, Advanced Event Mesh is explicitly designed to support event-driven architectures. It provides features like event brokers, topic-based routing, and guaranteed message delivery, which are hallmarks of EDA. The service enables scenarios such as real-time data integration, IoT event processing, and cross-application event notifications in SAP and non-SAP environments.

* Practical Usage: In SAP Integration Suite, Advanced Event Mesh is used to implement EDA by allowing integration flows (iFlows) to publish events to topics or subscribe to events from other systems. For example, an SAP S/4HANA system can publish an event (e.g., "Order Created") to Advanced Event Mesh, which other systems (e.g., a logistics application) can consume and process asynchronously.

Why Other Options are Incorrect:

* A. Publish-Subscribe pattern: While Advanced Event Mesh uses the publish-subscribe mechanism as a messaging pattern (where publishers send messages to topics and subscribers receive them), this is a lower-level messaging pattern, not an architectural pattern. EDA encompasses publish-subscribe as one of its implementation mechanisms, but EDA is the broader architectural pattern that defines the system's behavior and design. Thus, EDA is the more accurate answer for the architectural context.

* B. Microservices Architecture pattern: Microservices Architecture is a design approach where applications are built as independent, loosely coupled services. While Advanced Event Mesh can be used in microservices-based systems to enable asynchronous communication, it is not the primary architectural pattern it supports. Instead, it supports EDA, which can be applied within microservices or other architectures.

* D. Message Queue pattern: The Message Queue pattern involves point-to-point messaging where messages are sent to a specific queue and consumed by a single recipient. While Advanced Event Mesh supports queue-based messaging, its primary focus is on event-driven, topic-based communication, which is more aligned with EDA. Message queues are a subset of the capabilities provided by Advanced Event Mesh, but they do not represent the overarching architectural pattern.

SAP Integration Developer Workflow Example:

* Configure Event Mesh: In SAP Integration Suite, an Integration Developer configures Advanced Event Mesh by creating an event broker and defining topics or queues (e.g., sap.s4.order.created).

* Publish Events: An SAP system or external application publishes events to the topic using protocols like MQTT, AMQP, or REST.

* Subscribe to Events: Integration flows or external applications subscribe to the topic to consume events and trigger actions, such as updating a database or notifying another system.

* EDA Implementation: This setup enables decoupled, scalable communication, where multiple consumers can react to the same event without direct dependencies, embodying the EDA pattern.

References:

SAP Help Portal: SAP Integration Suite - Advanced Event Mesh - "Overview of Event-Driven Architecture" section, which describes how Advanced Event Mesh enables EDA through asynchronous event streaming.

SAP Advanced Event Mesh Developer Guide: Details the support for event brokers, topics, and subscriptions, emphasizing EDA as the core architectural pattern.

SAP Community Blogs: Articles such as "Event-Driven Integration with SAP Advanced Event Mesh" highlight how EDA is implemented using Advanced Event Mesh for real-time, loosely coupled integrations.

OASIS EDA Reference Model: Defines EDA as an architectural pattern where systems react to events, which aligns with the capabilities of Advanced Event Mesh in SAP Integration Suite.

質問 # 58

What is the relationship between an API provider and an API proxy in the API Management capability within SAP Integration Suite?

- A. The API provider manages secure API access for an API proxy.
- B. The API provider provides a unique URL for an API proxy.
- **C. The API proxy provides a unique URL and acts as a proxy for the API provider.**

正解: C

解説:

An API proxy is an API that acts as a proxy for another API, which is usually the backend service that provides the actual functionality. An API proxy can be used to add security, monitoring, caching, transformation, and other features to the backend API.

An API provider is a logical grouping of APIs that share a common connection to the backend service. An API provider can be used to discover and import APIs from the backend service into the API Management capability within SAP Integration Suite. The relationship between an API provider and an API proxy is that the API proxy uses the API provider as a source of information and configuration for accessing the backend service. The API proxy also provides a unique URL that can be used by clients to invoke the API without exposing the details of the backend service. Reference: SAP Integration Suite | SAP Community, Create an API Proxy | SAP Tutorials

質問 # 59

You are creating an API proxy. Which of the following is a valid path prefix?

- A. /sap/opo/odata
- B. /soap/opu/odata
- C. /sap/odu/odata
- D. /sap/opu/odata

正解: D

解説:

In SAP systems (e.g., S/4HANA, SAP Gateway), OData services follow a standard URL path:

/sap/opu/odata # The valid and official prefix for OData services.

Example: /sap/opu/odata/sap/API_BUSINESS_PARTNER

Other options:

/sap/opo/odata and /sap/odu/odata # Typographical variations, not valid.

/soap/opu/odata # Incorrect, since OData is not SOAP-based.

Thus, the valid prefix is /sap/opu/odata.

質問 # 60

You want to call an OData v4.0 interface through an adapter in the Cloud Integration capability within SAP Integration Suite. Which adapter can you use?

- A. HTTPS
- B. ProcessDirect
- C. SOAP
- D. JMS

正解: A

解説:

You can use an HTTPS adapter to call an OData v4.0 interface in the Cloud Integration capability within SAP Integration Suite. An HTTPS adapter allows you to send and receive messages over HTTP or HTTPS protocols. You can use an HTTPS adapter to communicate with RESTful services, such as OData v4.0, that support HTTP methods and formats.
