Professional HashiCorp - Terraform-Associate-003 - HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Examcollection Free Dumps

Our Terraform-Associate-003 Test Torrent keep a look out for new ways to help you approach challenges and succeed in passing the HashiCorp Certified: Terraform Associate (003) (HCTA0-003) exam. To be recognized as the leading international exam bank in the world through our excellent performance, our HashiCorp Certified: Terraform Associate (003) (HCTA0-003) qualification test are being concentrated on for a long time and have accumulated mass resources and experience in designing study materials. There is considerable skilled and motivated staff to help you obtain the HashiCorp Certified: Terraform Associate (003) (HCTA0-003) exam certificate. We sincerely wish you trust and choose us wholeheartedly.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q249-Q254):

NEW QUESTION # 249

How does Terraform determine dependencies between resources?

- A. Terraform requires resources in a configuration to be listed in the order they will be created to determine dependencies
- B. Terraform requires resource dependencies to be defined as modules and sourced in order
- C. Terraform automatically builds a resource graph based on resources provisioners, special meta-parameters, and the state file (if present)
- D. Terraform requires all dependencies between resources to be specified using the depends_on parameter

Answer: C

Explanation:

This is how Terraform determines dependencies between resources, by using the references between them in the configuration files and other factors that affect the order of operations.

NEW QUESTION # 250

Which provider authentication method prevents credentials from being stored in the state file?

- A. Setting credentials as Terraform variables
- B. Using environment variables
- C. Specifying the login credentials in the provider block
- D. None of the above

Answer: D

Explanation:

None of the above methods prevent credentials from being stored in the state file. Terraform stores the provider configuration in the state file, which may include sensitive information such as credentials. This is a potential security risk and should be avoided if possible. To prevent credentials from being stored in the state file, you can use one of the following methods:

Use environment variables to pass credentials to the provider. This way, the credentials are not part of the provider configuration and are not stored in the state file. However, this method may not work for some providers that require credentials to be set in the provider block.

Use dynamic credentials to authenticate with your cloud provider. This way, Terraform Cloud or Enterprise will request temporary credentials from your cloud provider for each run and use them to provision your resources. The credentials are not stored in the state file and are revoked after the run is completed. This method is supported for AWS, Google Cloud Platform, Azure, and Vault. References = : [Sensitive Values in State] : Authenticate providers with dynamic credentials

NEW QUESTION # 251

Define the purpose of state in Terraform

- A. State codifies the dependencies of related resources
- B. State lets you enforce resource configurations that relate to compliance policies
- C. State maps real world resources to your configuration and keeps track of metadata
- D. State stores variables and lets you quickly reuse existing code

Answer: C

Explanation:

The purpose of state in Terraform is to keep track of the real-world resources managed by Terraform, mapping them to the

configuration. The state file contains metadata about these resources, such as resource IDs and other important attributes, which Terraform uses to plan and manage infrastructure changes. The state enables Terraform to know what resources are managed by which configurations and helps in maintaining the desired state of the infrastructure. References= This role of state in Terraform is outlined in Terraform's official documentation, emphasizing its function in mapping configuration to real-world resources and storing vital metadata .

NEW QUESTION # 252

Multiple team members are collaborating on infrastructure using Terraform and want to format the* Terraform code following standard Terraform-style convention.

How should they ensure the code satisfies conventions?

- A. Use terraform fmt
- B. Run terraform validate prior to executing terraform plan or terraform apply
- C. Replace all tabs with spaces
- D. Terraform automatically formats configuration on terraform apply

Answer: A

Explanation:

The terraform fmt command is used to format Terraform configuration files to a canonical format and style.

This ensures that all team members are using a consistent style, making the code easier to read and maintain.

It automatically applies Terraform's standard formatting conventions to your configuration files, helping maintain consistency across the team's codebase.

References:

Terraform documentation on terraform fmt: Terraform Fmt

NEW QUESTION # 253

Which of the following is not a valid Terraform variable type?

- A. string
- B. map
- C. array
- D. list

Answer: C

Explanation:

This is not a valid Terraform variable type. The other options are valid variable types that can store different kinds of values.

NEW QUESTION # 254

.....

Our Terraform-Associate-003 exam questions almost guarantee that you pass the exam. Even if you don't pass, you don't have to pay any price for our Terraform-Associate-003 simulating exam for we have money back guarantee to all of our exam materials. I hope we have enough sincerity to impress you. And our pass rate of the Terraform-Associate-003 training engine is high as 98% to 100%, it is the data that proved and tested by our loyal customers. As long as you study with our Terraform-Associate-003 learning guide, you will pass the exam easily.
