So many candidates have encountered difficulties in preparing to pass the Integration-Architect exam. But our study materials will help candidates to pass the exam easily. Our Integration-Architect guide questions can provide statistics report function to help the learners to find weak links and deal with them. The Integration-Architect Test Torrent boost the function of timing and simulating the exam. They set the timer to simulate the exam and help the learners adjust the speed and keep alert.

Salesforce Integration-Architect Certification is a highly sought-after certification for professionals who work with Salesforce systems. The Salesforce Integration-Architect certification is designed to test the knowledge and expertise of professionals in the area of Salesforce integration. Salesforce Certified Integration Architect certification is a great way for professionals to prove their skills and knowledge in the area of Salesforce integration, and it is highly valued by employers.

Integration-Architect Learning Materials & Integration-Architect Valid Braindumps

In the era of information, everything around us is changing all the time, so do the Integration-Architect exam. But you don't need to worry it. We take our candidates' future into consideration and pay attention to the development of our Salesforce Certified Integration Architect study training dumps constantly. Free renewal is provided for you for one year after purchase, so the Integration-Architect Latest Questions won't be outdated. The latest Integration-Architect latest questions will be sent to you email, so please check then, and just feel free to contact with us if you have any problem. Our reliable Integration-Architect exam material will help pass the exam smoothly.

Salesforce Integration-Architect Certification Exam is designed to test the expertise of the integration architects in integrating various systems with Salesforce. Salesforce Certified Integration Architect certification enables integration architects to prove their skills in designing, building, and maintaining complex integrations between Salesforce and other systems. Salesforce Certified Integration Architect certification exam is a must-have for integration architects who want to advance their career by demonstrating their proficiency in Salesforce integration.

Salesforce Certified Integration Architect Sample Questions (Q48-Q53):

NEW QUESTION # 48

Service Agents at Northern Trail Outfitters uses Salesforce to manage cases and B2C Commerce for ordering. Which integration solution should an architect recommend in order for the service agents to see order history from a B2C Commerce system?

- A. A REST API offered by Commerce Platform
- **B. Salesforce B2C Commerce to Service Cloud Connector**
- C. REST API offered by Salesforce Platform
- D. Mulesoft Anypoint Platform

Answer: B

Explanation:

https://help.salesforce.com/articleView?id=icx_b2c_conversationcommerce_connector.htm&type=5

NEW QUESTION # 49

Universal Containers (UC) is a global financial company. UC support agents would like to open bank accounts on the spot for customers who inquire about UC products. During the bank account opening process, the agents execute credit checks for the customers through external agencies. At any given time, up to 30 concurrent reps will be using the service to perform credit checks for customers. Which error handling mechanisms should be built to display an error to the agent when the credit verification process has failed?

- **A. Handle integration errors in the middleware in case the verification process is down, then the middleware should retry processing the request multiple times.**
- B. In case the verification process is down, use mock service to send the response to the agent.
- C. In case the verification process is down, use fire and forget mechanism instead of Request and Reply to allow the agent to get the response back when the service is back online.

Answer: A

Explanation:

In a synchronous Request-Reply integration-where a bank agent is waiting for a real-time credit check to open an account-the error handling strategy must balance user experience with system resilience. Handling these errors at the Middleware layer is the architecturally preferred solution for managing complex retry logic and providing a clean response to Salesforce.

If the external credit agency's service is momentarily unavailable, the middleware (such as an ESB or MuleSoft) can automatically retry the request multiple times using a pre-defined strategy (e.g., exponential backoff). This "self-healing" behavior can often resolve transient network issues before the Salesforce agent even realizes there was a problem. If the retries fail, the middleware then returns a structured error message to Salesforce, which is displayed to the agent via the UI.

Option B (Fire and Forget) is unsuitable for this use case because the agent needs the result immediately to proceed with the bank account opening; they cannot afford to wait for a background process to finish hours later. Option C (Mock Service) is a testing tool and has no place in a production environment where real financial decisions are being made. By delegating error management to the middleware, UC ensures that its Salesforce instance remains performant (avoiding long-running request timeouts) while maximizing the chances of a successful credit check through automated, controlled retries.¹³¹⁴

NEW QUESTION # 50

What is the first thing an Integration Architect should validate if a callout from a LightningWeb Component to an external endpoint is failing?

- A. The endpoint URL has been added to Content Security Policies.
- B. The endpoint domain has been added to Cross-Origin Resource Sharing.
- **C. The endpoint URL has been added to Remote Site Settings.**
- D. The endpoint URL has added been to an outbound firewall rule.

Answer: C

Explanation:

Explanation

The first thing an integration architect should validate if a callout from a Lightning Web Component to an external endpoint is failing is the endpoint domain has been added to Cross-Origin Resource Sharing (CORS).

CORS is a mechanism that allows web browsers to make requests to servers on different origins, such as different domains, protocols, or ports. CORS requires the server to send back a special header that indicates whether the browser is allowed to access the resource or not. If the endpoint domain is not added to the CORS whitelist in Salesforce, the browser will block the callout and throw an error. Option B is not correct because Content Security Policies (CSP) are used to control what resources can be loaded on a Visualforce or Lightning page, such as scripts, stylesheets, images, etc. CSP does not affect the callout from a Lightning Web

Component to an external endpoint. Option C is not correct because outbound firewall rules are used to restrict the network traffic from Salesforce to external systems. Firewall rules are configured at the network level, not at the Salesforce level. Option D is not correct because Remote Site Settings are used to specify the domains that are allowed for callouts from Apex code, not from Lightning Web Components. References:
Working with CORS and CSP to Call APIs from LWC

NEW QUESTION # 51

Northern Trail Outfitters (NTO) uses Salesforce to track leads, opportunities and order details that convert leads to customers. However, Orders are managed by an external (remote) system. Sales representatives want to view and update real-time order information in Salesforce. NTO wants the data to only persist in the external system. Which type of Integration should an architect recommend to meet this business requirement?

- A. Data Visualization
- B. Batch Processing
- C. Process Orchestration
- D. Data Synchronization

Answer: A

Explanation:

Data Visualization is the type of integration that allows users to view real-time data from an external system without storing it in Salesforce. This can be achieved by using Lightning Web Components, Visualforce pages, or Canvas apps that display data from the external system using APIs or web services. Data Synchronization, Process Orchestration, and Batch Processing are types of integration that involve moving data between systems, which is not required by the business requirement. NEW QUESTION # 52

A Salesforce customer is planning to roll out Salesforce for all their Sales and Service staff. Senior Management has requested that monitoring is to be in place for Operations to notify any degradation in Salesforce performance. How should an integration consultant implement monitoring?

- A. Request Salesforce to monitor the Salesforce instance and notify when there is degradation in performance.
- B. Identify critical business processes and establish automation to monitor performance against established benchmarks.
- C. Use APIEVENT to track all user-initiated API calls through SOAP, REST or BULK APIs.
- D. Use Salesforce limits API to capture current API usage and configure alerts for monitoring.

Answer: B

Explanation:

The integration consultant should implement monitoring by identifying critical business processes and establishing automation to monitor performance against established benchmarks. This approach can help detect and diagnose any degradation in Salesforce performance, such as slow response time, high error rate, or low availability. The automation can use various tools and methods, such as platform events, event monitoring, health check, or third-party monitoring services.
