The NCP-MCA Certification is highly valued in the industry as it is an industry-recognized certification that helps IT professionals advance their careers.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q58-Q63):

NEW QUESTION # 58
An administrator would like to share an existing published Runbook across different Projects.
What must the administrator do to accomplish this task?

- A. Clone the Runbook, publish cloned Runbook to Marketplace without secret values.
- B. Clone the Runbook, publish cloned Runbook to Marketplace and select Projects to share with.
- C. Re-publish Runbook as a Marketplace item and select Projects to share with.
- D. Re-publish Runbook as a Marketplace item without secret values and select Projects to share with.

Answer: D

Explanation:
In Nutanix Self-Service (Calm), to share a Runbook across multiple projects, it must be published to the Marketplace.
When an administrator selects an existing Runbook and chooses the "Publish" option:
* Secret Handling:The system strictly enforces thatsecrets (passwords/keys) are not published. The administrator is required to verify that no secret values are hardcoded. Any sensitive variables are stripped or must be set to runtime input during the publication process.
* Project Selection:During the publication or approval workflow via theMarketplace Manager, the administrator configures theProject Sharingsettings. This determines which projects have access to view and execute the Runbook from the Marketplace.
It is not necessary to clone the Runbook first; the publication process itself creates the Marketplace entry derived from the source Runbook.

NEW QUESTION # 59
An administrator is unable to launch a Calm blueprint (new and old). Launching an existing blueprint under this condition fails with the error message:
The project for this blueprint does not have any associated Nutanix account.
Downloading and uploading the new blueprint also fails with
Launch with Variables' Profile expected to fall as Windows Server VWs attached with deleted Account.
Please modify them to use different account and try again.
Why is the administrator seeing this issue?

- A. The has not been created.
- B. The account is not verified.
- C. The account been deleted.
- D. The account is in a failed state.

Answer: C

Explanation:
The error messages indicate that the blueprint is trying to use a Nutanix account that no longer exists. This could happen if the account was deleted by another administrator or by a playbook action. The administrator should check the project settings and verify that the Nutanix account is still available and associated with the project. If not, the administrator should create a new account or use an existing one and update the blueprint accordingly. NEW QUESTION # 60
Which two items are required to create a Category via automation? (Choose two.)

- A. Value
- B. Purpose
- C. Name
- D. Tags

Answer: A,C

NEW QUESTION # 61
Refer to the exhibit.

The Playbook is designed to execute a script, in order to fix a known problem in the application. However, it keeps failing. Why is this Playbook continuing to fail?

- A. Slack configuration should be reviewed.
- B. The Playbook actions are in the wrong order.
- C. The script is incorrect.
- D. Not enough storage space in order to take a snapshot.

Answer: B

Explanation:
In the context of Nutanix Multicloud Automation (NCP-MCA), the order of actions in a playbook is crucial for its successful execution. In this case, the playbook is designed to execute a script to fix a known problem in an application but keeps failing because it attempts to power off the VM and take a snapshot before executing the script. The correct order should be to execute the script first, then power off the VM if necessary, and finally take a snapshot.
Nutanix Certified Professional - Multicloud Automation (NCP-MCA) 6.5 Exam: This is the official exam blueprint guide that covers the objectives, topics, and skills required for the certification. It also provides some sample questions and answers.
Nutanix Certified Professional - Multicloud Automation (NCP-MCA) Exam Blueprint Guide: This is another version of the exam blueprint guide that has similar content as the previous one.

NEW QUESTION # 62
What will a Quota Policy monitor and enforce?

- A. VM vCPU, Memory, Disk size
- B. Self-Service Application and Replication
- C. Self-Service Blueprint and Runbook count
- D. VM Power state, NIC count, IOPs

Answer: A

Explanation:

In Nutanix Self-Service (Calm), a Quota Policy limits the total infrastructure resources that can be consumed by a Project.5 When configuring a Project, the administrator sets limits for the following specific resources:

* vCPUs:The total number of virtual CPUs allocated to VMs in the project.
* Memory:The total amount of RAM (in GiB) allocated to VMs.
* Disk:The total storage capacity (in GiB) allocated to VMs.

These quotas are enforced during the provisioning process. If a user attempts to launch a blueprint that would cause the project to exceed these defined limits (vCPU, Memory, or Disk), the deployment will fail. Quotas do not monitor IOPs, NIC counts, or the number of blueprints stored.

NEW QUESTION # 63

......

Don't let the Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) stress you out! Prepare with our Nutanix NCP-MCA exam dumps and boost your confidence in the Nutanix NCP-MCA exam.
