## ISTQB Certified Tester Usability Tester Sample Questions (Q13-Q18):

### NEW QUESTION # 13

Which of the following is the correct distinction between formative and summative usability evaluation?

- A. Summative evaluations mostly rely on experts, formative evaluations require users
- B. Summative evaluations mostly rely on user tests, formative evaluations require experts
- C. Summative evaluations focus on improvement, formative evaluations assess the outcome
- D. Summative evaluations assess the outcome, formative evaluations focus on improvement**

**Answer: D**

Explanation:

Formative usability evaluation is conducted during the development process to identify usability problems and improve the product iteratively. It is diagnostic and improvement-focused. Summative evaluation, on the other hand, is done after development to assess the final product's usability, measuring how well it meets defined usability goals. Therefore, the correct distinction is that formative evaluation focuses on improvement, and summative evaluation assesses the outcome. This distinction aligns with widely accepted models such as those defined by ISO 9241-210 and usability.gov.

## NEW QUESTION # 14

How can the approach for conducting user surveys be summarized best?

- A. Write survey plan, write schedule, select questionnaire, recruit users, analyze, communicate
- B. Write survey plan, interview users and stakeholders, select questionnaire, deploy questionnaire, analyze, communicate
- C. Write survey plan, write schedule, select questionnaire, recruit users, remind users, communicate
- D. Write survey plan, interview users and stakeholders, select questionnaire, recruit users, remind users, communicate

**Answer: B**

Explanation:

Conducting user surveys involves a structured approach that ensures data collection is effective, reliable, and meaningful. The process typically starts with writing a survey plan, which defines the objectives, scope, target population, and methodology. Next, interviewing users and stakeholders is important to gather qualitative insights, refine survey questions, and align the survey with business goals and user needs.

Selecting or designing the questionnaire follows, which includes crafting clear, unbiased questions to capture the desired data. After that, deploying the questionnaire to the recruited participants is essential; this can be done via email, online tools, or in-person, depending on the context. Once the data is collected, it must be analyzed to extract meaningful patterns, trends, and insights. Finally, communicating the findings to stakeholders completes the process by informing decision-making.

Other options miss critical steps such as deploying the questionnaire (Option C), or combine steps incorrectly (Options A and D). Importantly, the step of interviewing users and stakeholders prior to deployment ensures the survey is well-informed and targeted, enhancing the quality and relevance of data collected.

## NEW QUESTION # 15

What is good accessibility?

- A. Good usability of a software product by people with limited vision, hearing, dexterity, cognition or physical mobility
- B. Good usability regardless of disturbances like bright sunlight, noise or wind
- C. Good usability of a software product by people with limited knowledge of the software
- D. Good usability of a software product on all devices (smart phone, computer, etc.)

**Answer: A**

Explanation:

Accessibility refers to designing products so that people with disabilities or limitations (permanent or temporary) can use them effectively. According to the Web Content Accessibility Guidelines (WCAG) and ISO standards, accessibility focuses on ensuring that users with vision, hearing, cognitive, or mobility impairments can access digital interfaces. Option D captures this intent accurately. The other options relate to general usability or responsiveness (e.g., device adaptability or user experience in noisy environments) but do not address the inclusive nature of accessibility as defined by official guidelines.

## NEW QUESTION # 16

Which of these basic approaches to a software development project follows all key elements of human-centered evaluation?

- A. Interview users, iteratively develop prototypes, and evaluate the software
- B. Iteratively develop prototypes, perform expert reviews, and integrate found issues
- C. Define requirements, develop the software, and perform acceptance test
- D. Interview users, develop the software, and perform acceptance test

## Answer: A

Explanation:

Human-centered design, as defined by ISO 9241-210, emphasizes early user involvement, iterative design, and continuous usability evaluation. Option D aligns with this model as it begins with understanding user needs (interview users), proceeds through iterative prototyping (which allows for continuous improvement), and involves user evaluation. This ensures that the final product is shaped by real user input and feedback.

Options A and B lack iteration and continuous evaluation, while option C, although partially aligned, lacks explicit user involvement in the evaluation process, focusing only on expert reviews.

## NEW QUESTION # 17

Which of the following statements best describe Rapid Iterative Testing and Evaluation?

- A. Testing focuses on instant redesigns and confirming made changes
- B. Testing is informal and many potential users can be accessed
- C. Testing happens on a regular basis, e.g. each Monday
- D. Testing is quantitative

## Answer: A

Explanation:

Rapid Iterative Testing and Evaluation (RITE) is a usability method in which usability issues are identified and addressed in short cycles. Unlike traditional usability testing, RITE allows for immediate redesigns and retesting of the improved version within the same study. The goal is to refine the design quickly based on observed usability issues. Option A confuses scheduling with methodology, B is too vague, and D inaccurately characterizes RITE as quantitative, while it is typically qualitative. Therefore, C accurately reflects the purpose and approach of RITE.
